Hydraena (s. str.) emineae sp. n. from Antalya, southern Turkey (Coleoptera: Hydraenidae)

MANFRED. A. JÄCH¹ & AHMET KASAPOĞLU²

Abstract

Hydraena (s. str.) emineae Jäch & Kasapoğlu, sp. n. from Antalya, southern Turkey is described. The new species is tentatively assigned to the H. (s. str.) eichleri d'Orchymont species complex.

Key words: Coleoptera, Hydraenidae, *Hydraena s. str.*, *Hydraena eichleri* species complex, taxonomy, Turkey, Antalya

Introduction

More than 105 species of *Hydraena* Kugelann, 1794 have been recorded from Turkey so far (see Jäch & Díaz 2001; Jäch 2004). While some of these species are rather widely distributed and common, others seem to be very rare and restricted to very small areas. The new species described herein definitely belongs to the latter group. The second author visited the type locality in southern Turkey (Antalya Province) three times (1999, 2002, 2004), but he was not able to collect more than a single specimen.

The aedeagus was drawn through a drawing tube attached to an Olympus BH2.

Hydraena (s. str.) emineae Jäch & Kasapoğlu, sp. n.

Type locality: Small stream, ca. 20 cm wide, slightly polluted because of cattle, flowing between cattle pasture and forest, Gökbel Yaylası, ca. 1000 m a. s. l., Tahtalı Mountain, ca. 18 km NNE Alanya, Antalya Province, southern Turkey.

Type material: Holotype ♂ (deposited in Naturhistorisches Museum Wien): "TR: ANTALYA ca. 18 km NNE Alanya \ leg. A. Kasapoğlu 20 VIII. 1999". Specimen dry
