Abstract

One new species of *Glenophisis* from Singapore is described: *Glenophisis singapura* **sp. n.** Key to the species of *Glenophisis* is also provided.

Key words: *Glenophisis*, new species, description, key, Singapore

Introduction

During a recent research to revise the inventory of the Orthoptera fauna in the Bukit Timah Nature Reserve (BTNR) and Central Catchment Nature Reserve (CCNR) of Singapore, one new species of *Glenophisis* Karny, 1926 was revealed: *Glenophisis singapura* **sp. n.**

Material and methods

Opportunistic collections of specimens were carried out mainly in the night in different trails within and around BTNR and CCNR of Singapore. Photographic images were done with a digital camera mounted to a microscope; habitus images and some larger details were photographed using digital SLR camera with compact-macro lens. Scales given with the images are approximate as the images taken with different equipment had to be adapted in size. Specimens were preserved by drying and pinning. Measurements of dried specimens were made using a 0.05 mm vernier caliper.

Depository

ZRC Zoological Reference Collection, Raffles Museum of Biodiversity Research, National University of Singapore

Systematic part

Tettigoniidae: Hexacentrinae

Genus *Glenophisis* Karny, 1926

Karny, 1926: 140

Type species: *Glenophisis pretiosa* Karny, 1926
