Corrections overview

There were major errors in three parts of the original paper (Michalczyk et al. 2012): (1) claw denotation system (lack of some square brackets), (2) diagnostic key (errors and omissions in points 8 and 12, respectively), and (3) Table 3 (minimal and maximal values swapped). In order to facilitate the use of the key and Table 3, we publish their correct versions entirely.

Proposal of a denotation system for the number of points on secondary branches in the genus *Milnesium*

[Number of points on external claws I–III–Number of points on internal claws I–III]–[Number of points on anterior claws IV–Number of points on posterior claws IV]

The diagnostic key to adult females of the recent *Milnesium* species

1. Dorsal cuticle smooth .................................................. 2 (tardigradum group)
   - Dorsal cuticle sculptured ............................................. 14 (granulatum group)

The *tardigradum* group:

2(1). Three spines present on dorso-caudal cuticle ........................................... *M. tardigradum trispinosa*
   - Dorso-caudal cuticle without spines ................................ 3

3(2). Primary branches on all legs absent ......................................................... *M. dujiangensis*
   - Primary branches on all legs present .......................................... 4

4(3). Four peribuccal lamellae present .............................................................. *M. tetralamellatum*
   - Six peribuccal lamellae present ......................................................... 5

5(4). Accessory points on primary branches absent ...................................... 6
   - Accessory points on primary branches present ................................ 8

6(5). Secondary branches of external claws I–III and of posterior claws IV with two points .......... *M. reductum*
   - Secondary branches of external claws I–III and of posterior claws IV with three points .......... 7

7(6). \( Pt \) of the primary branch IV length lower than 93% ................................. *M. longiungue*
   - \( Pt \) of the primary branch IV length equal or higher than 94% ...................... *M. zsalakoae*

8(5). Secondary branches of external claws I–III with two points ....................... 9
   - Secondary branches of external claws I–III with three points ................. 11

9(8). Secondary branches of anterior claws IV with two points ......................... *M. almatyense*
   - Secondary branches of anterior claws IV with three points .................... 10
