Abstract

The assassin bugs of the genus *Acanthaspis* Amyot & Serville (Reduviinae) from China are revised. Fourteen species are recognized, described or redescribed and illustrated. Three species, *A. fulviconnexa*, *A. melanota*, and *A. octoguttata*, are described as new to science. *Acanthaspis subinermis* Hsiao 1976 is synonymized with *A. laoensis* Distant 1919. A key for the identification of Chinese species of *Acanthaspis* is provided. The biology of *A. cincticus* Stål is briefly noted. The following species are newly recorded from adjacent countries: *A. collaris* Hsiao from Laos and Thailand, *A. geniculata* Hsiao from Vietnam, *A. picta* Hsiao from Laos, Myanmar and Thailand, *A. quinquespinosa* (Fabricius) from Nepal, *A. ruficeps* Hsiao from Laos, Thailand and Vietnam, and *A. laoensis* Distant from Thailand.

Key words: Reduviidae, *Acanthaspis*, new species, new records, China, Oriental Region

Introduction

Reduviinae is the second largest subfamily in family Reduviidae comprising about 1000 extant species in approximately 140 genera from all over the world (Putshkov & Putshkov 1985; Maldonado-Capriles 1990). *Acanthaspis* Amyot & Serville, 1843 is the second largest genus in Reduviinae, with about 110 valid known species, nearly 2/3 of them are distributed in the Oriental Region, and 1/3 of them in the Ethiopian (Maldonado-Capriles 1990).

Like the vast majority of reduviids, *Acanthaspis* species are generalist predators, usually occurring at the ground level, mainly found in hidden habitats, such as under stones, boulders and bark of fallen trees. Little published information is available on their preys. According to our observations on some species, they can feed on members of various insect orders and other arthropods. They are natural enemies of some agricultural and forestry pests, such as *A. pedestris* which can prey on some pests like the cotton bollworm *Helicoverpa armigera* (Hübner), the spotted bollworm *Earias fabia* (Stoll), the locust *Patanga succincta* (Linnaeus) and others (Ambrose & Sahayaraj 1991). Nymphs of some species of *Acanthaspis* have camouflaging behavior, disguising themselves with a cover of dusts, sands and soil particles, empty prey corpses and plant parts on their body surface, especially on the abdomen above, which is an interesting phenomenon of reduviid ethology (Cai *et al.* 2002; Weirauch 2006). Some species are specifically associated with ants and termites and exhibit camouflage behaviour (Odhambo 1958a, b; Brandt & Mahsberg 2002).

Acknowledgements

It is a pleasure to express our thanks to Drs. Gexia Qiao and Jun Chen, Mr. Jian Yao and Ms. Hong Liu (Zoological Institute, CAS), Profs. Wenying Yin, Weinian Zhang and Haisheng Yin (Shanghai Entomological Museum, CAS), Profs. Yalin Zhang and Yinglun Wang (Northwest A&F University), Profs. Shimei Zhang and Yujian Lin (Jiangxi Agricultural University), Drs. Jerome Constant and P. Grootaert (Institut Royal des Sciences Naturelles de Belgique) for their kind help with the loans of specimens for this study. Cai is much indebted to Mr. Mick Webb (The Natural History Museum, London) and Dr. Masaaki Tomokuni (National Museum of Nature and Science, Tokyo) for their most generous help during Cai's visits. We sincerely thank Dr. M. Malipatil (Department of Primary Industries Knoxfield Centre) and the anonymous reviewers for their critical reading of and helpful comments on the manuscript. This research is financially supported by the National Basic Research Program of China (No. 2013CB127600), the National Natural Science Foundation of China (No. 31372229), the National Key Technology R & D Program of the Ministry of Science and Technology (2012BAD19B00), the Special Fund for Scientific Research (No. 2012FY111100), the Special Fund for Agroscientific Research in the Public Interest (Nos. 201103012, 201103022, 201303024), and the Chinese Scholarship Council (No. 2011811071).
