Abstract

Published and unpublished data on the epigeic and cave centipedes of Sardinia (Italy) are summarized and critically revised in this paper. Fifty-four species are listed and discussed (1 Scutigeromorpha, 19 Lithobiomorpha, 6 Scolopendromorpha, 28 Geophilomorpha), two of which new to the island: *Lamyctes emarginatus* (Newport, 1844) and *Schendyla montana* (Attems, 1895). Thirty-one species have been recorded in caves (1 Scutigeromorpha, 14 Lithobiomorpha, 6 Scolopendromorpha, 10 Geophilomorpha) – including the poorly known *Plutonium zwierleini* Cavanna, 1881 – six of which exclusive of this habitat (5 *Lithobius* spp., 1 *Cryptops* sp.). Five species are introduced or probably introduced. General geographic distribution, chorotype, Sardinian localities and ecological notes (altitudinal ranges, habitats) are given for each species. Taxonomic notes are given for some species. *Lithobius turritanus* Fanzago, 1881 and *Lithobius molophai* Restivo De Miranda, 1978, previously considered synonyms of *Lithobius tricuspidatus* Meinert, 1872 and *Lithobius cerii* Verhoeff, 1943, respectively, are recognized as valid species, **status rev.** The new synonymies *Lithobius melanops domusnovae* Restivo De Miranda, 1976 = *Lithobius lapidicola* Meinert, 1872 **syn. nov.**, *Lithobius oligoporos* Latzel, 1884 = *Lithobius turritanus* Fanzago, 1881 **syn. nov.** and *Lithobius fraleliae* De Miranda Restivo, 1978 = *Lithobius turritanus* Fanzago, 1881 **syn. nov.** are proposed. *Lithobius turritanei* Restivo De Miranda i. l. in Cassola, 1982 is recognized as *nomen nudum*. *Cryptops breviunguis* A. Costa, 1882 is proposed as *species inquirenda* and its identity with *Cryptops anomalans* Newport, 1844 is rejected. *Lithobius molophai* Restivo De Miranda, 1978 and *L. sardous* Silvestri, 1898 are redescribed on type or topotypical material. A lectotype for *L. sardous* Silvestri, 1898 is also designated. *Lithobius sardus* Manfredi, 1956 **status nov.**, formerly a subspecies of *L. agilis* C. L. Koch, 1847, is raised to species level; its probable affinity with *L. turritanus* Fanzago, 1881 is also discussed. *Lithobius infossus*

Silvestri, 1894 (= *L. dahlii* Verhoeff, 1925) is erased from the centipede fauna of Sardinia, and previous records should be referred to an unidentified species of *Lithobius* or to *L. nuragicus* Zapparoli, 1997.

Key words: Scutigeromorpha, Lithobiomorpha, Scolopendromorpha, Geophilomorpha, lectotype designation, new synonymies, taxonomy, distribution, catalogue, Sardinia.

Historical background

Sardinia is one of the Mediterranean islands of main faunistic and zoogeographical interest and it has been the object of intensive scientific exploration since the first half of the 18th century, especially by Italian naturalists (Cassola 1983; Baccetti 1964, 1996).

The first records on epigeic centipedes dates back to the second half of the 19th century when Pirotta (1878) published the findings of *Scolopendra oraniensis* Lucas, 1846 from Vacca Island (SW Sardinia) and from near Cagliari (Cala Salinas, S Sardinia), collected during two expeditions of the cutter "Violante" by members of the Museum of Natural History of Genoa in 1875 and 1876. At about the same time, Magretti (1878, 1880), entomologist from Milan (Italy), published the results of his research carried out between 1877 and 1879 in Asinara Island (NW Sardinia) and a few other localities of the main island (Baccetti 1996; Cassola 1983; Manfredi 1981).

Soon after these first occasional reports, more substantial information was gathered by the Italian zoologist Achille Costa during his historical surveys on the "Geo-Fauna Sarda", conducted in 1881–1885 (Costa 1882, 1883, 1884a, 1884b, 1884c, 1884d, 1884e, 1885) (cf. Crovetti 1970), and data from the province of Sassari were added in the same period by the Italian myriapodologist Filippo Fanzago (Fanzago 1881a, 1881b, 1884a, 1884b, 1884c). A few other records from San Pietro Island (SW Sardinia) are due to Pietro Pavesi (De Carlini 1885), while collections in various parts of the island by the Italian entomologists and naturalists Raffaello Gestro, Umberto Lostia di Santa Sofia, Angelo Solari and Giovan Battista Traverso formed the subject of a note by Silvestri (1898). Material occasionally collected in 1896 by the German palaeontologist Eberhard Fraas was published by Verhoeff (1901: 412).

Further collections, so far unpublished, were made during the zoological expedition in northern Sardinia of the ship "Washington", of the Italian Royal Navy, under the command of Captain G. Cassanello in 1893, and by Giacomo Doria, the founder of the Museum of Natural History in Genoa, in the Gennargentu massif in 1899 (see under "Material and methods").

After this pioneering period, no papers on the epigeic centipedes of Sardinia were published before the seventies and eighties of the 20th century. Apart from the contributions of De Miranda Restivo (1978a [as Restivo de Miranda 1978a in References], 1982, 1983, 1986), based on material collected in those years, noteworthy is a paper by Eason (1980) in which the findings collected in 1957 by the Dutch myriapodologist C.A.W. Jeekel are described, laying the basis for a modern revision of the Sardinian centipede fauna. Other findings gathered by C.A.W. Jeekel in the same occasion were later discussed in Bonato *et al.* (2006).

More recently, the collections made during several surveys organized by the Italian universities of Genoa, Padua, Siena and Rome, and the natural history museums of Verona and Bergamo during the 1970's, form the bulk of a paper by Minelli (1983a), certainly the richest work ever prepared on the centipede fauna of the island in terms of material examined, collecting sites and information. This work was followed by those of Minelli *et al.* (1984), Minelli and Iovane (1987) and Zapparoli and Minelli (2005).

Other investigations later focused on the epigeic centipedes of Sardinia, namely those carried out in the small circumsardinian islands (Foddai *et al.* 1994; Minelli *et al.* 1994; Foddai *et al.* 1996), between 1985 and 1995, in the framework of a survey by the Italian National Council of Research by means of the oceanographic ship "Minerva" (Baccetti *et al.* 1989; Baccetti 1996).

Regarding the cave fauna, the first hypogean centipede record from Sardinia was collected in the area of Nuoro by the Genoese entomologist Agostino Dodero in 1903, even though the biospeleological exploration

of Sardinia had already begun some thirty years earlier (Grafitti 2002). This material was studied by Silvestri (1908) who described the first cave centipede of the area, *Lithobius doderoi*, endemic to the Nuoro province. Additional specimens from caves were to be collected long after, in the 1950's, mainly by Saverio Patrizi, Marcello Cerutti and Henri Henrot of the Circolo Speleologico Romano of Rome (Patrizi 1956a, 1956b), and were studied by Manfredi (1953, 1956). Other material collected by Augusto Vigna Taglianti and Valerio Sbordoni, also biospeleologists of the C.S.R., formed the subject of a note by Matic (1967), who described one of the most interesting European troglobitic lithobiomorph species, *Lithobius sbordonii*, endemic of coastal Supramonte in E Sardinia, near Nuoro.

Finds collected in the 1960's and 1970's, especially by Sardinian biospeleologists (S. Puddu, G. Grafitti), were studied by Restivo De Miranda (1976a, 1976b, 1977, 1978a, 1978b, 1983 [as De Miranda Restivo 1983 in the References]). A summary of the cave centipede fauna known in Sardinia at the beginning of the 1990's could be inferred from Minelli (1985).

An intense biospeleological and exploratory activity has been carried out in the subsequent years in many karst areas of the island, especially by local speleological groups (e.g., Grafitti *et al.* 1999; Grafitti 2002; Lana *et al.* 2004; Casale *et al.* 2006, 2008; Grafitti & Merella 2008). These investigations, still under way, allowed to greatly expand the knowledge on the cave centipede fauna of Sardinia (De Miranda Restivo & Guaita 1986; Grafitti & Zapparoli 1995; Zapparoli 1997, 2001). In spite of the numerous papers later published, the only and most recent summary of the epigeic and cave centipede fauna of Sardinia is that of Minelli (1983b).

The research on the arthropod communities of the Mediterranean forest habitats of the Reserves of Marganai and Monti Mannu (*cf.* Mason *et al.* 2006), sponsored by the Centro Nazionale per lo Studio e la Conservazione della Biodiversità Forestale “Bosco Fontana”, Verona, Italy (CNBFVR) and organized in cooperation with the Forestry and Environmental Surveillance Service (Ente Foreste Sardegna) of Sardinia, Italy, provided the opportunity to weigh up the centipede fauna of Sardinia. The aim of this paper is therefore to provide an updated synthesis of the knowledge on the distribution and ecology of the epigeic and cave centipedes of this island. About 1,100 epigeic and 145 cave bibliographic records from about 370 and 120 sites, respectively, have been revised. Some 2,200 specimens from about 225 epigeic sites and 60 caves have been examined.

Material and methods

The present catalogue is based on critically revised literature records and on unpublished material. Species are listed mostly according to Foddai *et al.* (1995) and Zapparoli and Minelli (2005). The classification of Edgecombe and Bonato (in press) was adopted for the Scolopendromorpha. Recent nomenclatural updates by Minelli (2006), Zapparoli (2006) and Bonato and Minelli (2008) are also considered.

For each species the following data are reported:

- scientific name, Author and year of publication according to Minelli (2006);
- bibliographic references concerning Sardinia are listed chronologically/alphabetically, with the name of the species, Author and year of description as originally quoted; data included in the electronic database of the project CK map (Checklist and distribution of the Italian fauna, Ruffo & Stoch 2006) are quoted as “Zapparoli and Minelli 2005: CD”; uncertain records are quoted with a “?” and discussed in the Remarks; dates of publication of the papers by A. Costa are given according to Pantaleoni (2005);
- literature records on the epigeic and cave collecting sites are arranged separately according to the historic administrative provinces (from north to south: Sassari, Nuoro, Oristano, Cagliari) and listed alphabetically; localities are spelled mainly according to the Road Atlas of the Touring Club Italiano (1999); in order to give a more precise location of the collecting sites, details or emendations on toponyms have sometimes been added in square brackets; generic quotations from the Corso-Sardinian geographic complex, Sardinia, and small circumsardinian islands (mostly based on previously published localities) are also included; except those in the section “Unreliable or erroneous records”, quotations based on original records

only vaguely reported are marked with §; each locality is followed by the corresponding bibliographic reference/s (given as a number directly referring to the list of bibliographic references for the species); for epigaeic localities, the elevation above sea level, as well as information on vegetal formation or habitat as originally quoted, is also given when available; for each cave, the cadastre number and elevation of cave entrance according to the still unpublished Speleological Cadastre of Sardinia (c/o Federazione Speleologica Sarda, Miniera di San Giovanni, Iglesias; G. Grafitti pers. comm.) are also given when available;

— the material examined is listed in the same way as the literature records: site, vegetal formation and/or habitat, elevation above sea level, date, number of specimens (males, females, immatures not belonging to larval stadia, larvae, unsexed specimens), collector and collection where the material is preserved are given for each record when available; collecting methods (mostly hand searching, pitfall trapping, soil washing and Berlese extraction, leaf-litter sifting) are detailed when known; body length of lithobiomorph larvae and adult scolopendromorphs (from the anterior margin of the head shield to the posterior end of the last trunk segment) as well as number of leg pairs in geophilomorphs are given when relevant; material followed by an asterisk (CMZ*) concerns records included in the electronic database of the project CK map (Zapparoli & Minelli 2005); the historical collections gathered during the zoological expedition of the ship “Washington” in 1893 and by Giacomo Doria in 1899 (see Historical background) are also included; also examined were some unpublished specimens identified by Filippo Silvestri at the end of the 19th century; the heading “Other” refers to materials published by Pirotta (1878), Silvestri (1898, 1908), Zapparoli (1982), De Miranda Restivo (1983) and Grafitti and Zapparoli (1995), here re-examined; labels of these materials are reported as in original and quoted in inverted commas, the corresponding bibliographic reference is quoted in square brackets, and the original identification is quoted if different;

— general geographic distribution, mainly as a list of the countries or geopolitical units from where the species is known, according to Zapparoli (2006) or critically revised from the literature (Minelli 2006) or from other updated checklists and reviews (e.g., Stoev & Geoffroy 2004; Bonato *et al.* 2005; Spelda 2005; Zapparoli and Minelli 2005; Lindner 2007; Akkari *et al.* 2008; Andersson *et al.* 2008; Barber 2008, 2009; Berg *et al.* 2008);

— chorotype according to Zapparoli and Minelli (2005), based on the classification proposed by Vigna Taglianti *et al.* (1993, 1999);

— ecological notes, as a synthesis of the available published and unpublished data on the altitudinal range and habitats colonized in Sardinia; for each habitat the number of sites where a species has been collected is given in parentheses; the number of records from endogeous habitats (collected by soil washing and Berlese extraction, L. Fancello leg.) is also given; a list of references where habitat data in Sardinia have been published is also given; a classification of the species recorded in caves according to the classic trogloxene, sub-eu-troglophilic and troglobitic categories (Balbiano d’Aramengo *et al.* 2004), replacing and updating the scheme of Cassola (1982: 706–707), is proposed;

— remarks, including taxonomic notes, comments on uncertain records and descriptions of the material examined where relevant; in the descriptions of lithobiomorph specimens, body length is measured from the anterior margin of the head shield to the posterior end of the intermediate tergite (adult specimens) or to the posterior end of the trunk (larvae).

The following abbreviations are used in the text and tables.

Repositories: CCA = Dipartimento di Biologia Animale ed Ecologia, Parassitologia, Università degli Studi di Cagliari, Cagliari (Italy); CFF = F. Fois collection, Cagliari (Italy); CFG = F. Gasparo collection, Trieste (Italy); CMZ = M. Zapparoli collection, Viterbo (Italy); CNBFVR = Centro Nazionale per lo Studio della Biodiversità Forestale “Bosco Fontana”, Verona (Italy); GGNU = Gruppo Grotte Nuorese, Nuoro (Italy); GSS = Gruppo Speleologico Sassarese, Sassari (Italy); IEASS = Istituto di Entomologia Agraria, Università degli Studi di Sassari, Sassari (Italy); MGE = Museo civico di Storia naturale “G. Doria”, Genoa (Italy); MVR = Museo civico di Storia naturale, Verona (Italy).

Perdu Pippiu, Teulada, "Grotta di Perdu Pippiu" 633 Sa/CA, 74 m, in the left branch, under stone: 30.IV.2006, ME, 1 ex (GSS). Cagliari prov.: "Carbonia, Su Porcili, Grotta dei Fiori 218 Sa/CA, 24.X.2004, E. Lana leg.", 1 larva (GSS) [in Lana *et al.* 2006: 44 under *Scutigera* sp.].

General distribution. Europe: Albania, Austria, Bosnia and Herzegovina, Bulgaria, Croatia (including Cherso Is.), Czech Republic, France (mainland, Corsica), Germany (southern), Greece (mainland, insular including Crete), Hungary (southern), Italy (mainland, Sicily, Sardinia), Republic of Macedonia, Malta, Montenegro, Portugal (mainland), Romania, Russia, Serbia, Slovak Republic, Slovenia, Spain (mainland, Balearic Isl.), Sweden, Switzerland, Ukraine (including Crimea); North Africa: Algeria, Egypt, Libya, Morocco, Tunisia; West Asia: Azerbaijan, Georgia, Iran, Irak, Jordan, Lebanon, Palestine, Syria, Turkey; Central Asia: Turkmenistan. Introduced in central and northern Europe (British Isl., Channel Is.?, mainland Denmark, north and central France, The Netherlands), Atlantic islands (Azores Isl., Bermuda Isl., Cabo Verde Isl., Canary Isl., Madeira Is., Salvage Isl., St. Elena Is.); Austral Africa (Angola, Cameroon, Kenya, Mozambique, Republic of South Africa, Tanzania, Zimbabwe); North (Canada, USA), Central (Mexico) and

South (Argentina, Uruguay) America; South-east Asia (Taiwan, Vietnam) (Stoev & Geoffroy 2004; Andersson *et al.* 2008).

Chorotype. Centralasiatic-Mediterranean.

Ecological notes. 0–870 m; mostly in open or semi-open Mediterranean habitats (one record from garrigue), but also in agricultural habitats (vineyards, one site with many records), in *Eucalyptus* sp. plantations (one record) and in human settlements (one record); also in caves (8 sites, 70–200 m; subtroglophilic species).

Remarks. The material quoted under *Scutigera* sp. by Lana *et al.* (2006) from Carbonia, Su Porcili, “Grotta dei Fiori” 218 Sa/CA, has been here examined and refers to this species.

Order LITHOBIMORPHA Pocock, 1895

Henicopidae Pocock, 1901

Lamyctes Meinert, 1868

2. *Lamyctes emarginatus* (Newport, 1844)

Literature records

None.

Material examined

Epigeic. Sassari prov.: Sorso, Azienda Nali, mixed orchard, pitfall traps: 23.V.1997, leg.?, 2 ♀♀ (IEASS); 3.VI.1997, 2 ♀♀ (IEASS); 6.VI.1997, 3 ♀♀ (IEASS); 12.VI.1997, 2 ♀♀ (IEASS); 2.VII.1997, 2 ♀♀ (IEASS); 10.VII.1997, 1 ♀ (IEASS); 22.XII.1997, 2 ♀♀ (IEASS); 7.I.1998, 1 ♀ (IEASS); 13.I.1998, 1 ♀ (IEASS); 10.II.1998, 1 ♀ (IEASS); 18.II.1998, 1 ♀ (IEASS); 10.III.1998, 2 ♀♀ (IEASS); 13.V.1998, 1 ♀ (IEASS); 1.VI.1998, 1 ♀ (IEASS); 19.VI.1998, 1 ♀ (IEASS). Cagliari prov.: Villasor, vineyard Giviamolas (turfed), pitfall traps: 14.III.2003, FS, 1 ♀ (IEASS); 28.V.2003, FS, 1 ♀ (IEASS); 2.VII.2003, FS, 3 ♀♀ (IEASS); 26.V.2004, FS, 7 ♀♀ (IEASS); 2.VII.2004, FS, 4 ♀♀ (IEASS).

Cave. No records.

General distribution. Species of Australasian origin (western and southern Australia including Tasmania; also known in New Caledonia, New Zealand, Chatham, Fiji and Kermadec Isl. but probably not indigenous), now cosmopolitan as introduced throughout temperate parts of North America, including Greenland and Newfoundland, in the Canary, Azores and Faroe Isl., Iceland, Europe, Near East, North Africa, East Africa, north-east Asia, Kurile and Hawaii Isl., South America (Brazil) (see, e.g., Mesibov 1986; Eason 1992; Hollington & Edgecombe 2004; Andersson *et al.* 2008).

Chorotype. Cosmopolitan.

Ecological notes. Although no data have been recorded, elevation preferences of this species in Sardinia probably range between 20 and 130 m; in agricultural habitats (mixed orchards, 1 site; vineyards, 1 site).

Remarks. No previous records for this species in Sardinia.

Lithobiidae Newport, 1844

Eupolybothrus Verhoeff, 1907

Subgenus *Eupolybothrus* Verhoeff, 1907

3. *Eupolybothrus (Eupolybothrus) fasciatus* (Newport, 1845)

- 1) *Eupolybothrus fasciatus* (Newport, 1845): Minelli 1983a: 13.
- 2) *Eupolybothrus fasciatus* (New. 1845) [sic]: Minelli 1983b: 407.

Literature records

General. Sardinia (2, 3, 4).

Epigeic. Sassari prov.: Olbia, 30 km SE (1, 5).

Cave. No records.

Material examined

No records.

General distribution. Europe: Italy (mainland; Sardinia and Aeolian Isl., introduced) (Foddai *et al.* 1995).

Ecological notes. Epigeic species, no data on the Sardinian population/s.

Remarks. Apparently an unreliable record. Although data from Sardinia have been considered as probably related to unintentional anthropogenic introductions (Foddai *et al.* 1995), possibly in recent times, a label error is also possible. Subgeneric assignment according to Jeekel (1967).

Subgenus *Allopolybothrus* Verhoeff, 1907

Santadi, Punta Su Campu ‘e Su Casteddu, “Grotta della Scaletta” or “Grotta de Sa Scala” 2705 Sa/CA, 780 m: 10.III.2007, GG, 1 larva with 10 lp (GSS).

Other. Nuoro prov.: “*Lithobius impressus* L. Koch”, “M. Gennargentu/Magg. 1871/R. Gestro [leg.]”, 2 ♂♂, 2 ♀♀ [in Silvestri 1898: 681 under *Lithobius* (s. s.) *impressus* C. Koch] (MGE). “*Lithobius impressus*, C. Koch/Isili”, 1 ♂, 2 ♀♀ together with 1 ♀ of *L. castaneus* [in Silvestri 1898: 681 under *Lithobius* (s. s.) *impressus* C. Koch] (MGE). Cagliari prov.: “*Lithobius impressus*, L. Koch”, “Sarrabus/Magg. [18]73/R. Gestro”, 2 ♂♂, 1 ♀ together with 1 ♀ of *L. castaneus* [in Silvestri 1898: 681 under *Lithobius* (s. s.) *impressus* C. Koch] (MGE).

General distribution. Europe: France (mainland, Corsica), Italy (mainland, Sicily, Sardinia), Malta; reported also from Spain, but record needs confirming. North Africa: Algeria (north), Morocco (north-east), Tunisia (north).

Chorotype. W-Mediterranean.

Ecological notes. 0–1800 m; thermophilous species but few data from oakwoods (*Quercus ilex*, 2 sites), pine (1 site) and *Eucalyptus* sp. plantations (1 site) as well as garrigue (1 site) and agricultural habitats (walnut orchards, 1 site) are available; a vague record from open habitats (1 site) is also known; sometimes in caves (7 sites, 95–780 m; trogloxene species). One record from an endogeous habitat. See also De Miranda Restivo (1982).

Remarks. Except for the uncertain records of *Eupolybothrus fasciatus*, this is the only species of the genus present in the study area. Records from Sardinia published under *E. impressus* (C. L. Koch, 1841) or *E. elongatus* (Newport in Lucas, 1849) by the Authors (also in *Lithobius* Leach, 1814, in *Bothroplys* Wood, 1862 or in *Polybothrus* Latzel, 1880) are here listed under *E. nudicornis* according to the synonymies supposed by Jeekel (1967) but formerly proposed by Silvestri (1896a, 1897). The identity of *E. impressus* and *E. elongatus* and their possible synonymy with *E. nudicornis* have been also discussed in Eason (1972a, 1972b, 1980). Among the subspecies described for *elongatus* is *sardus* Manfredi, 1956, only known from the type locality (Oliena, Cannagosula, “Grotta Su Guanu” 103 Sa/NU), the identity of which needs to be confirmed in the framework of a complete revision of the group (Eason 1972a). The above records of *E.*

grossipes (C. L. Koch, 1847) and *E. tridentinus* (Fanzago, 1874) are certainly due to misidentification as the two species only occur in continental Europe (e.g., Eason 1982; Zapparoli & Minelli 2005), and they must be referred to *E. nudicornis*. To this species are also referred the specimens quoted under *Bothropolys* sp. and *Eupolybothrus nudicornis corsicus* (Legér & Duboscq, 1903) in De Miranda Restivo (1982) and De Miranda Restivo and Guaita (1986), respectively. Part of the material from Sardinia published by Silvestri (1898) under *Lithobius impressus* C. L. Koch, 1841 (specimens from Gennargentu, Isili and Sarrabus) has been re-examined and must be referred partly to this species, partly to *L. castaneus* Newport, 1844 (see below). Subgeneric assignment according to Jeekel (1967).

not *Lithobius doderoi alighericus* [sic]: Puddu 1970: 85, 88.

Literature records

General. Sardinia (11, 13, 19, 20, 21, 22).

Epigaeic. No records.

Cave. Sassari prov.: Capo Caccia, “Grotta Verde” 3 Sa/SS, 90 m (type locality of *Lithobius doderoi aligherus* Manfredi, 1953) (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 14, 15, 16, 17, 18, 23, 24, 25, 26, 27, 28, 29).

Material examined

Epigeic. No records.

Cave. Sassari prov.: Alghero, Capo Caccia, “Grotta Verde” 3 Sa/SS, on the cave floor, in the main branch, near the big stalagmites: 7.X.2001, MM, 3 imm. ♂♂ (GSS); 13.IV.2002, MM, 1 ♂ (GSS).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities.

Ecological notes. Found only in the cave “Grotta Verde” 3 Sa/SS, Sassari province; probably a eutroglophilic species.

Remarks. A revision of the identity of this species has been published by Zapparoli (2001). The record under “*Lithobius*” quoted in Patrizi (1952) refers to this species, whereas the quotation of *L. doderoi alighericus* [sic] from Ussassai, “Grotta di Tacchixeddu”, Nuoro province published in Puddu (1970) refers to *L. doderoi* (see below). Included in the list of threatened invertebrate troglobitic species of Italy by Priano (1992).

Monti Mannu [Punta Piscina Argolas], 282 m, near guestrooms, under *Populus* sp., leaf-litter sifting: 14.XI.2006, MZ, 1 larva (CMZ). Sarrabus: without date, GT, 1 ♂ “*Lithobius castaneus* Newp.” F. Silvestri det. (MGE). Villacidro, Punta Fenu, 300 m, 32S 0472097 4357122, hand searching: 11.XI.2006, MZ, 1 larva (CMZ); ibidem, under stones, pinewood: 11.XI.2006, BNWZ, 1 imm. (CNBFVR).

Cave. Nuoro prov.: Orani, Monte Gonara “Grotta di San Francesco” 202 Sa/NU, 560 m: 15.VI.2007, PM & AC, 1 imm. ♂ (CMZ). Sadali, “Grotta de Su Guanu” [= Sadali, Foresta di Addoli, “Grotta de Is Janas” 51 Sa/NU, 780 m]: 27.V.1901, DO, 1 ♂ (MGE). Usassai, “Grotta Sa Ucca de Babois” 36 Sa/NU: 9.V.1967, VS & AVT, 1 imm. (CMZ). Cagliari prov.: Santadi, Is Zuddas, “Grotta Il Campanaccio” 2529 Sa/CA, 130 m: 14.IV.2007, ME, 1 larva (GSS).

Other. Nuoro prov.: “*Lithobius impressus*, C. Koch/Isili”, 1 ♀ together with 1 ♂, 2 ♀♀ of *E. nudicornis* [in Silvestri 1898: 681 under *L. (s. s.) impressus* C. Koch] (MGE). Cagliari prov.: “*Lithobius impressus*, L. Koch”, “Sarrabus/Magg. [18]73/R. Gestro [leg.]”, 1 ♀ together with 2 ♂♂, 1 ♀ of *E. nudicornis* [in Silvestri 1898: 681 under *L. (s. s.) impressus* C. Koch] (MGE).

General distribution. Europe: Austria (south), Bosnia and Herzegovina, Croatia, France (mainland, Corsica), Italy (mainland, Sicily, Sardinia), Malta, Portugal (mainland), Serbia, Slovenia, Spain (mainland); records from Bulgaria requires confirmation; North Africa: Algeria, Morocco, Tunisia; Central America: Guatemala (introduced, established?).

Chorotype. S-European.

Ecological notes. 0–1800 m; woodland species mostly occurring in oakwoods (*Quercus ilex*, 11 sites; *Q. pubescens*, 1 site), pinewoods (1 site) and riparian habitats (under *Populus* sp., 1 site; *Alnus* sp. and *Nerium oleander*, 1 site); also in shrub and open Mediterranean habitats (under *Pistacia lentiscus*, 1 site; *Erica arborea* and *Arbutus unedo*, 1 site; vague records from garrigue, 1 site, and maquis, 1 site, are also known) as well as in montane formations (*Juniperus* sp. shrubs, 2 sites; *Alnus* sp. shrubs, 1 site); seldom in human settlements (1 site) and orchards (1 site); sometimes in caves (14 sites, 130–1040 m; subtroglophilic species). Four records from endogeous habitats. See also Minelli (1983a), Minelli and Iovane (1987) and De Miranda Restivo (1978, 1982, 1986).

Remarks. Quotations of *Lithobius audax* Meinert, 1872 published by Fanzago (1881b) and Costa (1885), afterwards copied by Silvestri (1898), are here referred to this species according to Eason (1974). The record of *L. fanzagoi* Fedrizzi, 1876a quoted by Fanzago (1881b) from the neighbourhood of Sassari and then referred to *L. piceus* by Silvestri (1898) is here tentatively assigned to *L. castaneus* only in part as Fanzago's (1881b) description seems composite, probably based on specimens of this species and of another species of *Lithobius*, maybe *L. turritanus* (see below). Part of the material from Sardinia published by Silvestri (1898) as *Lithobius impressus* C. L. Koch, 1841 has been re-examined and must be referred partly to this species (specimens from Isili and Sarrabus, see Other material), partly to *Eupolybothrus nudicornis* (see above).

Ulassai, “Grotta de Sa Foxi de S’Abba” 728 Sa/NU, 875 m (type locality of *Lithobius doderoi* Silvestri, 1908) (1, 2, 3, 4, 5, 10, 15 as “Grotta de S’Abba” [sic], 20, 29, 31, 32, 33, 35, 37). Ulassai, “Grotta di Su Marmori” or “Grutta de Su Mamuri” 55 Sa/NU, 880 m (type locality of *Lithobius doderoi* Silvestri, 1908) (1, 2, 3, 4, 5, 7, 9, 10, 15, 19, 20, 26, 29, 30, 31, 32, 33, 35, 36, 37, 39). Ulassai, Tacco di Ulassai, “Grotta Is Chillottis” 727 Sa/NU, 855 m (26, 29, 32, 33, 35, 37). Ulassai, Tacco di Ulassai, [Monte Tisiddu], “Grotta de Is Janas” [or “Grutta Basoccu”] 715 Sa/NU, 830 m (26, 29, 30, 32, 33, 35, 37). Ulassai, Trodori, “Grotta Risorgente di Funtana Trodori” 730 Sa/NU, 745 m (26, 29, 32, 33, 35, 37). Ulassai, Trodori–Bruncu Preugheddu, “Grotta [di] Trodori” 674 Sa/NU, 793 m (26, 29, 32, 33, 35, 37). Ulassai, Truculu, “Grotta de Is Lianas” or “Sa Rutt’e Noa” or “Grotta Truculu” 193 Sa/NU, 905 m (29, 32, 37). Ussassai [generic quotation for the caves of the area] (39). Ussassai, “Grotta Su Stampu ‘e Marceddu” or “Grotta Su Stampu ‘e Trulu” 765 Sa/NU, 975 m (32, 35, 37). Ussassai, Tacchixeddu, “Grotta di Tacchixeddu” 829 Sa/NU, 1010 m (8, 38). Nuoro prov./Cagliari prov.: Ulassai/Villaputzu, Monte Cardiga, Su Pranu, “Grotta S’Angurtigorgiu Mannu” [= “Grotta S’Angurtidorgiu Mannu”] 4 Sa/NU-CA, [470 m] (26, 32, 35).

Material examined

Epigeic. No records.

Cave. Nuoro prov.: Gairo, Genn ‘e Ua, “Grotta di Bulverera” 138 Sa/NU, 50 m from cave entrance: 18.XII.1999, JD, 1 ♀ (GSS). Gairo, Genn ‘e Ua, “Grotta di Genn ‘e Ua” 43 Sa/NU, 50 m from cave entrance: 18.XII.1999, JD, 1 imm. ♀ (GSS). Gairo, Taquisara, “Grotta de Sa Rena” (= “Grutta de S’Arena”) 673 Sa/NU: 26.XII.2004, JD, CO & SP, 2 imm. ♂♂, 1 imm. ♀ (GSS). Gairo Taquisara, “Grotta di Taquisara” 86 Sa/NU: 25.IV.2004, CO, JD & FM, 1 ♂ (GSS). Osini, Tacco di Ulassai, “Grotta Su Lioni” 222 Sa/NU: 9.II.1999, CO, 1 imm. ♂, 1 imm. ♀ (GSS). Ulassai, Su Marmori, “Grotta Su Marmori” 55 Sa/NU: 4.VIII.2003, MM, 1 imm. ♂ (GSS).

Other. The following material, belonging to the type series of Silvestri (1908): Nuoro prov.: “*Lithobius Doderoi* Silv./Gr. di Genneua (Gairo)/ A. Dodero [leg.] – 25.V.1901”, “*Lithobius doderoi* Silv./det. F. Silvestri/Sardegna: Gr. di Genneua (Gairo)/25.V.1901 leg. A. Dodero”, 2 ♂♂, 2 ♀♀, 5 imm. [in Silvestri 1908: 647] (MGE). “*Lithobius Doderoi* Silv./Gr. de su Marmori (Ulassai)/ A. Dodero [leg.] – 24.V.1901”, “*Lithobius doderoi* Silv./det. F. Silvestri/Sardegna: Gr. de su Marmori (Ulassai)/25.V.1901 leg. A. Dodero”, 1 ♂, 2 ♀♀, 1 imm. ♀ [in Silvestri 1908: 647] (MGE).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, S-European affinities.

Ecological notes. Only in caves of the Nuoro province, 470–1010 m a.s.l. (26 sites; eutroglophilic species).

Remarks. This species has been recently redescribed and discussed in Zapparoli (2001). De Miranda Restivo (1983) erroneously located the cave “Is Gianas”, type locality of *Lithobius zachii*, in the municipality of Pozzomaggiore instead of Seulo and named the cave “de Sa Foxi de S’Abba” as “Grotta de S’Abba”. Included in the list of threatened invertebrate troglobitic species of Italy by Priano (1992).

8. *Lithobius (Lithobius) forficatus* (Linnaeus, 1758)

Literature records

General. Sardinia-Corsica (5). Sardinia (3, 4, 8, 11).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2, 7, 12). Cagliari prov.: Monte [dei] Sette Fratelli, NW slope, maquis, 300 m (6, 7, 9).

Cave. Cagliari prov.: Fluminimaggiore, “Grotticella di Corona Arrubiu” 58 Sa/CA (10).

Material examined

No records.

General distribution. Europe: Albania, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Denmark (mainland, Faroe Is.), Finland, France (mainland, Corsica but introduced), Germany, Great Britain, Greece (mainland), Hungary, Iceland, Ireland, Italy (mainland; Sicily, Sardinia but probably introduced), Malta?, Montenegro, Norway, Poland, Republic of Macedonia, Romania, Serbia, Slovak Republic, Slovenia, Sweden, Switzerland, The Netherlands; North Africa: Algeria (introduced?), Tunisia (introduced?); West Asia: Georgia, Russia (Krasnodar Province), Turkey; East Asia: Kuriles Isl. (introduced); North America: Canada, Greenland, USA (introduced); South America: Brazil (introduced); Pacific islands: Hawaii Isl. (introduced), Atlantic islands: St. Elena Is. (introduced).

Chorotype. European.

Ecological notes. One record at 300 m a.s.l.; one generic record from maquis (De Miranda Restivo 1986) and one record from caves (troglobiont species).

Remarks. Although epigeic and cave records have been recently published (De Miranda Restivo 1983, 1986; De Miranda Restivo & Guaita 1986) and the more updated checklists of the Italian centipedes (Foddai *et al.* 1995; Zapparoli & Minelli 2005) include this species in the Sardinian fauna, the real presence of *L. forficatus* on the island deserves confirmation as reliable evidence has never been collected (see also Minelli 1983b). Confusion with immature specimens of *Eupolybothrus nudicornis* is suspected.

9. *Lithobius (Lithobius) inermis* L. Koch, 1856

- 1) *Lithobius flavus* Meinert: Fanzago 1881b: 7.
- 2) *Lithobius (Archilithobius) flavus* Mein.: Silvestri 1898: 683.

not *Lithobius (Lithobius) inermis*: De Waele & Pisano 1998: 27.

Literature records

General. Sardinia (4, 6, 7).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2, 5). Nuoro prov.: Fonni, Rio Taloro, meadow and mosses (3, 8). Park of Laconi, mosses near waterfalls (3, 8).

Material examined

No records.

General distribution. Europe: Italy (Sardinia, Sicily), Spain (mainland, Balearic Isl.); North Africa: Morocco (Eason 1975; Zapparoli & Minelli 2005).

Chorotype. W-Mediterranean.

Ecological notes. No data on elevation range; apart from some vague records from meadows or mosses near waterfalls (Minelli 1983a), no data are available on the habitat of this species in the study area.

Remarks. Quotations of *Lithobius flavus* Meinert, 1872 published in Fanzago (1881b), then copied by Silvestri (1898) and De Miranda Restivo (1983), are referred to this species according to Eason (1974). The cave records of *L. inermis* published in Grafitti and Zapparoli (1995: 126), and then in De Waele and Pisano (1998), were here re-examined and must be referred to *L. nuragicus* Zapparoli, 1997 (see below).

Other. Sassari prov.: “Sardegna, SS [= Sassari prov.], Bono o’Uccaidu, 1000 m, 31.III.1972, A. Vigna [leg.]”, 1 ♀ (CMZ) [in De Miranda Restivo 1983: 117 under *Monotarsobius microps* Mein. 1868]. “Sardegna, SS [= Sassari prov.], Limbara, Vallicciola, 1000 m, 30.III.1972, A. Vigna [leg.]”, 2 exx (CMZ) [in De Miranda Restivo 1983: 116 under *Monotarsobius dubosqui* [sic] Brlo. [sic] 1896]. “Sardegna, SS [= Sassari prov.] Oschiri, 7.III.1968, R. Argano [leg.]”, 2 exx (CMZ) [in De Miranda Restivo 1983: 117 under *Monotarsobius microps* Mein. 1868]. Cagliari prov.: “*Lithobius lapidicola*, Meinert/Ussana”, 2 ♀♀, 1 imm. ♀ [in Silvestri 1898: 683 under *Lithobius* (*Archilithobius*) *lapidicola* (Mein.)] (MGE).

General distribution. Europe: Albania, Austria, Bosnia and Herzegovina, Czech Republic, Denmark (mainland), France (mainland, Corsica), Germany, Great Britain, Greece (mainland, Ionic Isl.), Hungary, Ireland, Italy (mainland, Sicily, Sardinia), Montenegro, Norway, Poland, Romania, Slovak Republic, Slovenia, Spain (mainland, Canary Isl.), Sweden, Switzerland, The Netherlands, Ukraine.

Chorotype. Centraleuropean.

Ecological notes. 0–1800 m; few habitat records exist for this euryoecious species: in *Quercus ilex* (3 sites), *Q. suber* (1 site) and pine woods (1 site), garrigue (1 site), montane formations (*Alnus* sp. shrubs, 2 sites); also in agricultural habitats such as orchards (1 site), cherry orchards (1 site), vineyards (1 site), walnut (1 site) and hazel groves (1 site); also in caves (16 sites, 200–920 m; trogloxene species). Four records from endogeous habitats. See also De Miranda Restivo (1982) and Minelli and Iovane (1987).

Remarks. Quotations of *Lithobius borealis* Meinert, 1868, published by Fanzago (1881b) then copied by Silvestri (1898), Verhoeff (1925a), Attems (1949), Minelli (1978a) and De Miranda Restivo (1983), as well as those of *L. pusillus* Latzel, 1880, published by Minelli (1978a) and De Miranda Restivo and Guaita (1986), are referred to this species according to Eason (1974). Old records of *L. lapidicola* by Fanzago (1881b) are considered uncertain according to Eason (1980), as well as those of Costa (1885). Part of the records of Silvestri (1898) have been here re-examined and confirmed. Quotations of *Monotarsobius grafitti* published by Restivo De Miranda (1976a), Cassola (1982), De Miranda Restivo (1983) and De Miranda Restivo and Guaita (1986), are referred to this species following Minelli (1983b). The record of *L. lapidicola* from Porto Torres is probably due to a misreading of literature data by De Miranda Restivo (1983). Records of *Monotarsobius manfrediae* Bianchi in Bianchi *et al.*, 1949 from the cave of San Giovanni published by De Miranda Restivo and Guaita (1986) are here tentatively referred to this species according to Foddai *et al.* (1995). Records of *M. microps* (Meinert, 1868) from the cave Su Coloru, published by De Miranda Restivo (1983), are referred to this species according to Grafitti and Zapparoli (1995). Records of *M. duboscqui* Brölemann, 1896, from Mount Limbara, and *M. microps* (Meinert, 1868), from Oschiri and Bono, published in De Miranda Restivo (1983) have been re-examined and must refer to this species. The quotation of *Lithobius calcaratus* C.L. Koch, 1844 from Sant'Anatolia (Sassari province) published by Fanzago (1881b) and assigned to this species by Zapparoli and Minelli (2005), is not included in the above list of literature records as it is here considered uncertain (see below in the “Unreliable or erroneous records” section, under *L. calcaratus*).

Lithobius melanops domusnovae Restivo De Miranda, 1976, very defectively described from “Grotta di San Giovanni” near Cagliari and considered an unrecognizable taxon by Minelli (1983b), must be referred to this species as material from the type locality corresponding to the original description of Restivo De Miranda (1976b) does not differ from the description of Sardinian specimens of *L. lapidicola* given by Eason (1980). The specimen with 3+4 prosternal teeth, assumed to be anomalous (see Restivo De Miranda 1976b: 90, fig. 4), also mentioned in the original description of *L. m. domusnovae* and apparently not included in the type series, probably belongs to another species of *Lithobius*, maybe *L. nuragicus*, the presence of which in the same cave has been verified (see below). The new synonymy is therefore proposed: *Lithobius melanops domusnovae* Restivo De Miranda, 1976 = *Lithobius lapidicola* Meinert, 1872 **syn. nov.**

Worthy of notice is a female from the above mentioned cave (M. Mucedda leg., 1.V.2004) showing a supplementary *L. borealis*-like spine on the praefemur of the left 15th leg (right leg mutilated).

The unidentified Lithobiidae from Cuglieri, Monte Santu, “Grotta di Monte Santu” 206 Sa/OR quoted by Grafitti (2007b) and the record of *Lithobius* sp. from Domusnovas, Monte Acqua, “Grotta di San Giovanni” 81 Sa/CA published by Lana *et al.* (2006), have been here examined and belong to this species.

Description. Colour: body and legs yellow, head darker. Length: 10.0–11.0 mm (cave of Lu Gardu), 12.0 (caves of Molafà and Maristella), 12.5 (Grotta Verde), 16.0 mm (cave of Dragunara). Antennae: long, about two thirds of body length, of 52–53 (Lu Gardu), to 55–57 (Molafà), 60–63 (Grotta Verde), 66–66 (Maristella), 72 (Dragunara) articles; last article twice as long as the penultimate; articles almost long as broad, densely covered by long setae. Head: weakly rugose, 1.1 mm long, 1.2 mm broad, broader than T. 1, posterior border rounded. Ocelli: absent. Organ of Tömösváry: large; close to the organ of Tömösváry, in antero-dorsal position are generally one-two setae, when two setae are present the dorsal one is longer than the ventral. Prosternum: with 3+4, 4+4, 5+5 (Lu Gardu, Fig. 1), 4+4 (Molafà, Fig. 2), 5+5 (Maristella), 5+6 (Badde), 7+7 (Dragunara) small, rounded teeth; in an abnormal male from Grotta Verde, the teeth are completely absent (Fig. 3). Tergites: T. 1 subtrapezoid, the lateral borders convergent forwards, broader than T. 3, with posterior border emarginate; posterior border of TT. 3, 5, 7, 8, 10, 12 and 14 slightly emarginate, those of TT. 9, 11 and 13 straight; posterior angles of TT. 3 and 5 almost rounded, those of TT. 7, 8, 10, 12 and 14 angulated, those of TT. 9, 11 and 13 angulated and without triangular posterior projections. Intermediate tergite with posterior border straight. Tergites with sparse, small and thin setae on the anterior part; lateral and posterior borders with longer and relatively stouter setae, more numerous on T. 14 in larger specimens. Sternites with some setae on a transverse line on the anterior part, setae present also along the lateral and posterior borders; setae of sternite 15 more numerous and regularly arranged mostly on the posterior part. Setae numerous especially on the antennae and legs, mostly on the ventral side. Numerous setae also present on the ventral side of the

1st–3rd and 14th–15th coxae; coxae 4th–13th bearing a smaller number of setae. Coxal pores: circular, small, arranged in a row, 3, 3, 4, 3 or 4, 4, 5, 4 (Lu Gardu), 4, 5, 5, 4 (Molafà), 6, 6, 6, 6 (Grotta Verde, the proximal pore is circular in shape, the distal ones are elliptical), 6, 7 (8), 8, 5 (Maristella) or elliptical, large, 8, 8, 7, 9 in the larger specimen (Dragunara); pores are separated from one another by a space equal or smaller than their own diameter. Anterior legs: 1st–13th legs with articulate tarsus. Fourteenth and 15th legs: about half of body length, slender, 15th accessory apical claw absent; in both sexes with a faint latero-internal longitudinal sulcus on femur, tibia and tarsus (Fig. 4). Principal claw of all legs long, 1st–14th legs with a long accessory apical claw, about half as long as the principal claw; between the principal claw and the accessory claw a long accessory seta is also present. VaC spine: absent. Glandular pores: on internal side of femur, tibia and tarsus of 14th and 15th legs. Spinulation: see Tabs 1–5. Female gonopod: with 2+2 sharp spurs (Fig. 5) and a tridentate large claw (Fig. 6). Male genitalia: first genital sternite with twelve setae on each side, second genital sternite without setae, gonopod short, consisting of a single article with two (Maristella, Grotta Verde) or three (Molafà) apical setae.

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities (?).

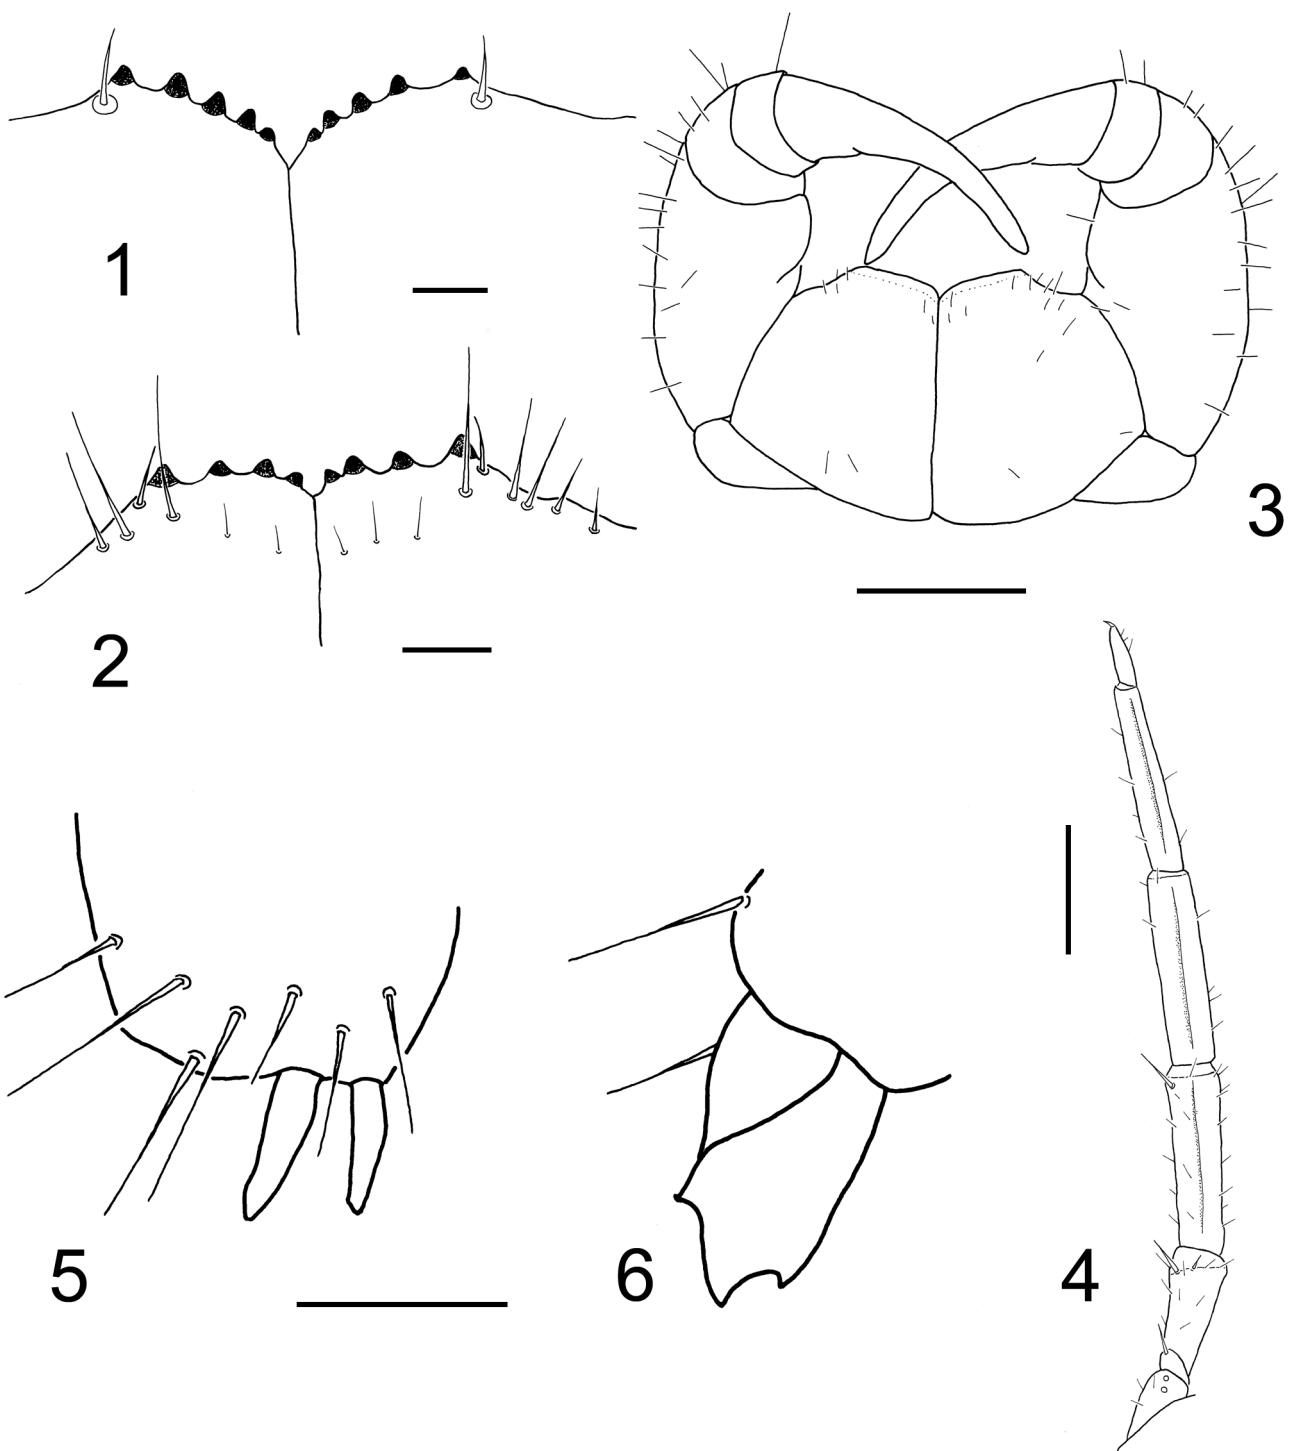

Ecological notes. Troglobitic species, found only in caves of the Sassari province, 10–320 m a.s.l. (5 sites).

TABLE 4. *Lithobius molophai* Restivo De Miranda; Capo Caccia, “Inghiottitoio della Dragunara” 174 Sa/SS, 1 ♀: spinulation; 15th t, P, F and Ti mutilated (?), presumed spines in square parentheses.

Remarks. The present examined specimens were collected in four caves of the same karst area of Sardinia including the type locality of *Lithobius molophai*, the cave of Molafà (Sassari province). Such specimens apparently belong to a same cave specialized taxon in spite of the differences in some morphological characters probably related to size, such as body length, number of antennal articles, number of

prosternal teeth and number and shape of coxal pores. These characters fit quite well with the original description of *L. molophai*, although the latter is inadequate in some details such as the latero-internal longitudinal sulcus on the 14th and 15th legs observed in all the specimens here examined but not quoted in the original description, probably because overlooked. This feature seems however a good differential character between *L. molophai* and *L. cerii* Verhoeff, 1943a, a morphologically close troglobitic species described from a cave of Capri island (Campania, Italy) in which such furrows have however not been quoted in both the descriptions of Verhoeff (1943a, 1943b) and the synonymy of which with *L. molophai*, although generally accepted by the subsequent Authors (e.g. Foddai et al 1995; Zapparoli & Minelli 2005), has been only hesitantly proposed by Minelli (1983b). A latero-internal longitudinal sulcus on the 14th and 15th legs is also present in other W-Palaearctic epigeic and cave *Lithobius* species, such as those of the W-Mediterranean *L. inermis* L. Koch, 1856 group and the SE-European and NW-Anatolian *L. lakatnicensis* Verhoeff, 1926 group (Serra 1987; Zapparoli 2003), but their relationships with *L. molophai* have not yet been stated. Some differences between *L. molophai* and *L. cerii* are also found in the pattern of the spinulation of the legs. Although the spine arrangement of *L. cerii* is not known in full detail, the spinulation of the 14th and 15th legs of *L. molophai* seems poorer than in *L. cerii*; moreover, a 15 VaC is present in *L. cerii* (see Verhoeff 1943a) but not in *L. molophai*. In spite of their morphological resemblance, likely due to convergent adaptation to the same habitat, the identity of *L. molophai* with *L. cerii* is rejected and both species must be considered as valid. The distinction between *L. molophai* and *L. cerii* seems also confirmed by their geographic ranges, restricted to the caves of NW Sardinia and Capri island, respectively. Also zoogeography suggests a distinction between the two species: these areas have a different origin and age and belong to two distinct Italian faunistic provinces, the cave faunas of which form two historically and zoogeographically individual groups (Latella & Stoch 2001; Minelli et al. 2004).

The materials published as *Lithobius* sp. by Casale et al. (2006) or “Chilopodi ciechi” [= blind Chilopoda] by Lana et al. (2006) from Bancaleddu, “Grotta di Lu Gardu” 2936 Sa/SS and as *Lithobius* sp. by Lana et al. (2006) from Alghero, Capo Caccia, Cala Dragunara, “Inghiottoio della Dragunara” 174 Sa/SS have been here examined and refer to this species.

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities.

Ecological notes. Mostly in caves (10 sites), 70–429 m a.s.l.; one old epigeic record near sea level (Sassari prov., Golfo Aranci, 1903) needs to be confirmed; eutroglophilic species.

Remarks. This species was described on a single female from “Grotta di Su Benatzu” or “Grotta Pirosu”, Su Benatzu, Santadi, Cagliari province. Records from “Grotta Prima di Corongiu de Mari” near Corongiu de Mari, Cagliari province, published by Zapparoli (1982) under *Lithobius dahli* Verhoeff, 1925, and from “Grotta Su Stumpu ‘e Muscione Stunnu” Asuni, Monte Perdedu, Abba Suergiu, Oristano province, published

by Grafitti and Zapparoli (1995) under *L. inermis* L. Koch, 1856 (see also De Waele and Pisano 1998), have been here re-examined and must also be referred to this species. The record from “Grotta di Santa Vita”, Iglesias, Corongiu de Mari, a cave of the same karst area, published by De Miranda Restivo and Guaita (1986) under *L. pilatoi* Matic, 1968, probably also refers to *L. nuragicus*. The specimen with 3+4 prosternal teeth from “Grotta di San Giovanni” 81 Sa/CA, Domusnovas, Cagliari province, apparently belonging to the paratype series of *L. melanops domusnovae* Restivo De Miranda 1976b and assumed as anomalous in the original description of this taxon (see Restivo De Miranda 1976b: 90, fig. 4), probably belongs to *L. nuragicus* as well, as its presence in the cave has been verified on new material recently collected.

Additional remarks on the material examined. The new material from “Grotta di Su Benatzu”, the type locality of this species, agrees well with its original description. Of the two specimens examined, the mature male (G. Merella leg., 22.IV.2007) shows the following characters: body length 16.0 mm, antennae mutilated but at least 12.0 mm long and with 72 articles; ocelli small, 1 + 3, 2, as in Fig. 7; prosternum with 3+4 teeth, without shoulder lateral to porodont; coxal pores 5, 5, 6, 5; 15th leg 10.0 mm long, with a distal dorsal rounded protuberance on the tibia (Fig. 8). First genital sternite with 16–17 setae on each side; second genital sternite with two setae; gonopod large, of two articles, with three setae on the proximal and one apical seta on the distal one. Spinulation as in Tab. 6. From the same locality is also an immature male 14.0 mm long, with 1+3 small and not contiguous ocelli, large organ of Tömösváry, 4+3 conical forcipular teeth, antennae mutilated with at least 48 articles, 4, 4, 5, 4 circular coxal pores. Although less developed, the protuberance on 15th tibia is present as well.

Specimens from “Grotta di San Giovanni” (Domusnovas) and “Grotta S’Oghittu” (Fluminimaggiore), both in Cagliari province, also agree well with the type and topotype material of *L. nuragicus*, although the single mature female from the former locality has a slightly higher number of antennal articles (86–89). The mature male (body length 22.0 mm) from “Grotta S’Oghittu” also shows the already described distal dorsal rounded protuberance on tibia 15 (Fig. 9). Moreover, a distal dorsal small and well circumscribed pit surrounded by about 12 short setae is present on the 14th tibia (Fig. 10). This structure is not evident in the two above-mentioned males from “Grotta di Su Benatzu”, probably because they are not fully mature.

The mature female from “Grotta di San Michele”, Ozieri, Sassari province, differs from the original description in the following characters: body 23.0 mm long, antennae 12.0–12.5 mm long with 76–77 articles, terminal article three times longer than the penultimate; 1 + 17 (right side), 1 + 15 (left side) small and scarcely pigmented ocelli arranged in 3–4 irregular rows (Fig. 11); coxal pores 6, 8, 9, 7; gonopod without lateral denticle. Spinulation as in Tab. 7. In the same locality, a specimen assigned to the 4th larval stadium – as it has well developed legs on 1st–12th segments – was collected, the characters of which are compatible with those of the above-mentioned adult female, suggesting conspecificity. Its main features are: body length 5.5 mm, antennae of 12 (mutilated)–27 articles, 4.0 mm long, 3+3 prosternal teeth, 1 + 1, 2 ocelli on each side, anterosuperior ocellus very small, organ of Tömösváry large.

From the neighbouring “Grotta del Carmelo”, Ozieri, Sassari province, a larva with developed legs on 1st–12th segments was collected, the characters of which are compatible with those of the above-mentioned larva; it has therefore been assigned to *L. nuragicus* as well. However, it differs in having antennae of 24 (mutilated)–29 articles, 3.5 mm long, 1 + 1, 2 ocelli on each sides, anterosuperior of the same size of the other ocelli.

The two immature specimens (post-larval stadia) from Capo Figari, Golfo Aranci, “Pozzo di Su Passu Malu”, Sassari province, show characters compatible with those of the above mentioned specimens and are thus assumed conspecific: body length 9.9 and 13.0 mm, colour yellow, antennae 4.0 and 8.5–9.0 mm long of 44 (left side, right side mutilated) and 57–58 articles, 3+3 prosternal teeth, ocelli 1 + 2, 1 or 1 + 2, 2 and 1 + 1, 2, 2, 1 or 1 + 2, 2, 3, not well defined and poorly pigmented, respectively. The immature male labelled “Sardegna/Golfo Aranci/Apr. 1903/C. Figini [leg.]” (MGE), apparently collected in an epigaeic site of the same area, despite being mutilated seems conspecific with these two cave specimens. Its main features are: body length 8.0 mm, colour yellow, antennae of 40–40 articles, 5.0 mm long, ocelli indistinct on the righ side, unpigmented and apparently 1+1 on the left side, 3+3 prosternal teeth, coxal pores round 2, 2, 2, 2.

The specimens from Corongiu de Mari, “Grotta Prima di Corongiu de Mari”, Cagliari province, quoted under *L. dahli* in Zapparoli (1982), and from Iglesias, “Grotta Grande di Corongiu de Mari”, Cagliari province, and Asuni, “Grotta Su Stampu ‘e Muscione Stunnu”, Oristano province, both quoted under *L. inermis* in Grafitti and Zapparoli (1995), all re-examined here, although in bad conditions and mutilated of many legs, show characters that fit well with those of the above-mentioned materials and with the holotype of *L. nuragicus*, therefore they are here assigned to this species. The material quoted under *L. dahli* are represented by two specimens with well developed legs on 1st–10th segments (assigned to the 3rd larval stadium), one specimen with well developed legs on 1st–12th segments (assigned to the 4th larval stadium) and one postlarval specimen. The two larvae with 1st–10th legs have body 4.1–5.0 mm long, colour yellow, antennae 3.0–3.5 mm long of 24–24 articles, 3+3 prosternal teeth, ocelli 1+1 or 1+1, 1 semipigmented; the larva with 1st–12th legs has body 5.0 mm long, colour yellow, antennae both mutilated but at least 3.5 mm long and with 22 antennal articles, 3+3 prosternal teeth, ocelli 1 + 1, 1, unpigmented; the postlarval specimen has body 6.5 mm long, colour yellow, antennae 5.0 mm long of 37 articles on one side, mutilated on the other side, 3+3 prosternal teeth, ocelli 1+1, 1 semipigmented. The material quoted under *L. inermis* is represented by an immature female (Iglesias, “Grotta Grande di Corongiu de Mari”), 15.0 mm long, colour dark yellow, antennae 9.0–10.0 mm long with 62–64 articles, 3+3 prosternal teeth, ocelli 1 + 3, 4 (left side), 1 + 4, 2 (right side), organ of Tömösváry larger than the ocelli, gonopods not fully developed but with 2+2 spurs and unidentate claw, and an immature male (Asuni, “Grotta Su Stampu ‘e Muscione Stunnu”), 10.0 mm long, colour light yellow, antennae about 6.0 mm long with 44–46 articles, 3+3 prosternal teeth, ocelli 1 + 2, 2 (left side), 1 + 2, 3 (right side), organ of Tömösváry indistinct.

The record published by Lana *et al.* (2006) under *Lithobius* sp. from Su Benatzu, Santadi, “Grotta di Su Benatzu” 576 Sa/CA has been here examined and belongs to this species.

(India) and Sao Tomé Is. (Gulf of Guinea) (Eason 1974, 1985; Cawley 1999).

Chorotype. W-European.

Ecological notes. 800–1600 m; woodland species, recorded from *Quercus ilex* woods (2 sites), riparian habitats (under *Alnus* sp., 1 site; under *Alnus* sp. and *Nerium oleander*, 1 site) and montane formations (*Alnus* sp. shrubs, 2 sites); also in caves (2 sites; troglobiont species). See also De Miranda Restivo (1982) and Minelli and Iovane (1987).

Remarks. This species has been recorded in Sardinia only from the Gennargentu massif and adjacent areas, Nuoro province.

Literature records

General. Sardinia-Corsica (5). Sardinia (3, 6, 7, 8, 9).

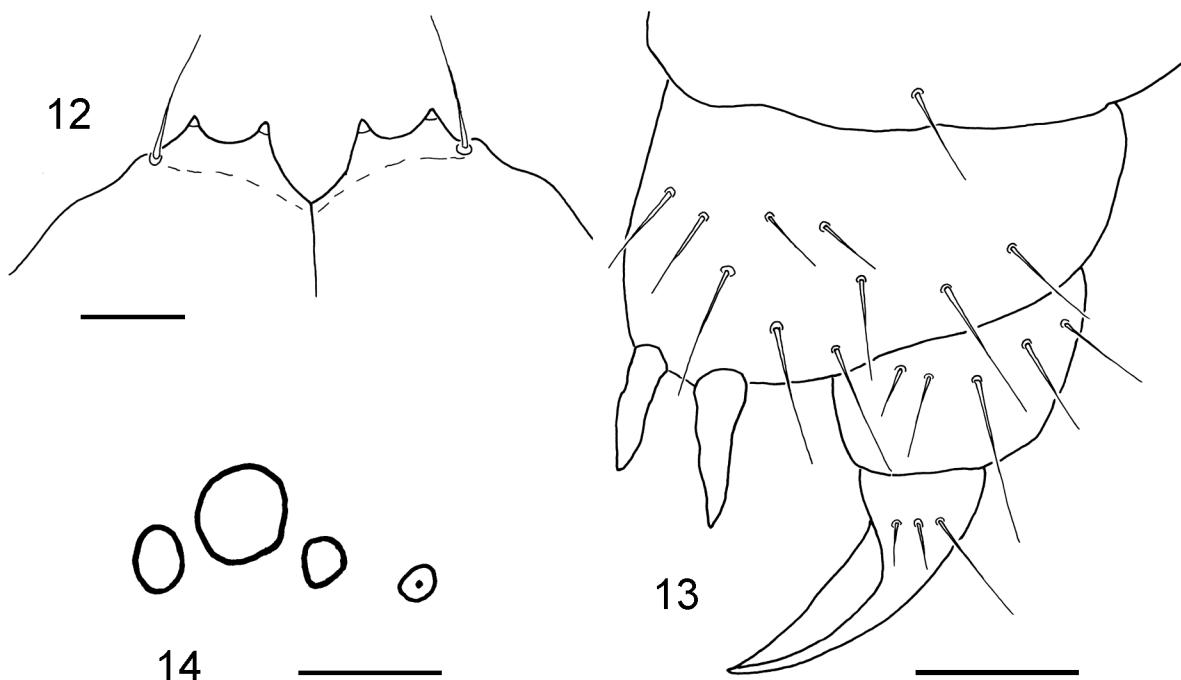

Epigaeic. Cagliari prov.: Cagliari (type locality of *Lithobius (Archilithobius) sardous* Silvestri, 1898) (1, 2, 4); ibidem, Sant'Elia (10).

Material examined

Epigaeic. Cagliari prov.: Domusnovas, Valle di Oridda: 28.II.1971, AVT, 3 ♀♀ (CMZ). Muravera, San Priamo, soil washing and Berlese extraction: 25.XI.2006, LF, 1 ♀ (CMZ). Sant'Elia: 18.II.1971, AVT, 1 ♂, 3 ♀♀ (CMZ*). Quartu: II.1895, leg.?, 1 ♀ “*Lithobius* sp.”, F. Silvestri det. (MGE).

Cave. No records.

Other. Cagliari prov.: “*Lithobius sardous*, Silv./cotypi/Cagliari”, 1 ♂ (paralectotype, M. Zapparoli designavit 2008), 1 ♀ (lectotype, M. Zapparoli designavit 2008) in 75% ethanol [in Silvestri 1898: 683] (MGE).

FIGURES 12–14. *Lithobius sardous* Silvestri (♀, lectotype, Cagliari, Sant'Elia), scale bars: 0.1 mm. **12.** Prosternum in ventral view, setae not shown. **13.** Left gonopod, ventral. **14.** Right ocelli and organ of Tömösváry (dotted).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities (?).

Ecological notes. Species apparently related to sites at low elevation; no record from caves; erroneously quoted as a cave species by Minelli and Iovane (1987: 20). One record from an endogeous habitat.

Notes on the type material. The lectotype is hereby designated by selecting, among the two specimens labelled as cotypes, the female specimen described below; lectotype and paralectotype have been arranged in two separate vials, both placed in a larger vial with the original china ink label.

Description of lectotype. Female. Colour light chestnut. Size 9.0 mm long, 1.25 broad at T. 10. Head slightly broader than long; broader than T. 1; lateral marginal interruption distinct; posterior border straight; antennae one third of body length, 3.0 mm long, of 37 (right) – 38 (left) articles, last article four times longer than the penultimate; ocelli 1 + 1, 1 on each side, depigmented, difficult to see, arranged in a single almost horizontal row, the median ocellus about twice as large the others; organ of Tömösváry obscure; prosternum with 2+2 triangular teeth, porodont long and setiform but stouter than a seta, no shoulders lateral to porodont, lateral sides of coxosternite gently sloping behind porodents (Fig. 12). T. 1 slightly narrower than T. 3, almost trapeziform, posterior border straight; lateral borders of TT. 3, 5, 7 almost parallel, feebly convergent posteriorly in TT. 8 and 10, convergent posteriorly in TT. 12 and 14; posterior border of TT. 3 and 5 very feebly emarginate, straight in TT. 7, 12 and 14, feebly emarginate in T. 8, emarginate in TT. 10; posterior angles rounded in TT. 3, 5, 8 and 10, angulated in TT. 7, 12 and 14; posterior angles of TT. 9, 11 and 13 without triangular projections, angulated in T. 9, rounded in TT. 11 and 13; TT. 2, 4 and 6 with posterior border straight, lateral borders almost parallel, posterior angles angulated or blunt; intermediate tergite with posterior margin straight. Coxal pores small, circular, 3, 3, 3, 3, separated from one another by their own diameter or more, proximal pore smaller than the distal ones. Female gonopod with two relatively long and well separated spurs, the outer larger than the inner and lanceolate; claw long and almost narrow, without lateral denticles (Fig. 13). Tarsal articulation on 1st–13th legs not well-defined; praefemur, femur, tibia and tarsi of 14th and 15th legs missing; VaC absent; spinulation as in Tab. 8.

TABLE 8. *Lithobius sardous* Silvestri; Cagliari, lectotype, male: spinulation; 12th DmP on one side only; 14th and 15th t, P, F, Ti mutilated (?).

Description of paralectotype. Male. Differing from the lectotype in the following features: size 8.0 mm long, 1.0 mm broad at T. 10; antennae 2.5 mm long, of 38 articles with last article three times longer than the penultimate one on right side, mutilated at 27th article on left side; coxal pores 2, 2, 2, 2; praefemur, femur, tibia and tarsi of 14th leg missing; 15th leg 2.0 mm long without secondary sexual characters, glandular pores on internal side of praefemur, femur and tibia; 15th leg with a small accessory apical claw; spinulation as in Tab. 9.

Description of other specimens. Differing from type material in the following features: colour light chestnut, yellowish; size 9.5 to 10.5 mm long; antennae 3.2 to 4.0 mm long, of 34–36 articles, last article 2–3 times longer than the penultimate; ocelli as in Fig. 14, feebly pigmented; organ of Tömösváry close to the ocelli and about the size of the smaller ones (Fig. 14); coxal pores 2, 2, 2, 2 in the male, 2, 2, 2, 3 or 3, 3, 3 in the females; male gonopod of a single article with a long apical seta; second genital sternite covered with 6–7 scattered short setae; spinulation as in Tab. 10, a 15 VaP spine, apparently abnormal, is present on the right leg of a female specimen.

Remarks. *Lithobius sardous* was described briefly and without figures by Silvestri (1898), based on an unspecified number of specimens from Cagliari. No other records are known in the literature apart from those much later published by Zapparoli and Minelli (2005), also from Cagliari province. The record from Villasalto, “Grotta e’ Scusi”, Cagliari province, published by De Miranda Restivo (1983) and included in Zapparoli and Minelli (2005), is erroneous and must be referred to *L. sardus* Manfredi, 1956 (see below).

Lithobius sardous had never been discussed from a taxonomic point of view before Minelli (1983a), who considered it of uncertain identity or, at least, morphologically close to *L. inermis* L. Koch, 1856.

Based upon the present material, *L. sardous* seems quite different from *L. inermis*, a species from North Africa and the Iberian Peninsula, also known from Sardinia (see above), belonging to a group of W-Mediterranean taxa characterized by a latero-internal longitudinal sulcus on the 14th and 15th legs (Serra 1987); moreover, in *L. inermis* body size is larger, number of prosternal teeth, ocelli, antennal articles and coxal pores is generally greater and leg spinulation is richer (see Bröleman 1930) than in *L. sardous*. *Lithobius sardous* seems instead closely related to another group of W-Mediterranean *Lithobius* including *L. hispanicus hispanicus* Meinert, 1872, from south Spain (including Balearic Isl.) and North Africa, and *L. h. alicatai* Matic in Matic *et al.*, 1967, from central Spain and central and northern Portugal (Eason 1974; Serra 1979; Vadell 2007). With these taxa it shares the general body size, the number of prosternal teeth, the small number of ocelli, the pattern of spinulation and, chiefly with *L. h. alicatai*, the shape of the female gonopod.

General distribution. Europe: Italy (Sardinia) (Zapparoli & Minelli 2005).

Chorotype. Sardinian endemic, W-Mediterranean affinities (?).

Ecological notes. Mostly in caves (23 sites, 90–950 m a.s.l.; eutroglophilic species); a doubtful record exists from an epigeic site, in *Quercus pubescens* woods.

TABLE 11. *Lithobius agilis* C.L. Koch, *L. turritanus* Fanzago and *L. sardus* Manfredi: comparative table of morphological characters.

	<i>Lithobius agilis</i>	<i>Lithobius turritanus</i>		<i>Lithobius sardus</i>
Reference	Eason 1964	Fanzago 1881 [in original]	Eason 1980 (as <i>Lithobius tricuspis</i> Meinert, 1872)	Manfredi 1956 (as <i>Lithobius agilis</i> Koch <i>sardus</i> n. subsp.)
Body length (in mm)	8–11	11	12–16	16–17
Colour	chestnut-brown	testaceous-brown [testaceo-brunneus]	not quoted	brown or pinkish brown, sternites lighter
Integument	not punctate; setae fairly long	evidently wrinkled, densely covered with setae [manifeste et dense rugosus et pilosus]	not quoted	smooth, with long and sparse setae
Cephalic shield	slightly broader than long	almost square, posteriorly straight [lamina cephalica subquadrata, postice truncata]	not quoted	rounded
Number of antennal articles	31–35	33–35	35–48	56–57
Antennal length	about one third of body length	5 mm, not reaching half of body length [dimidiam partem corporis longitudinis non attingentes]	one third of body length	more than half of body length
Number of ocelli and arrangement	7–11: 1 + 3, 2, 1; 1 + 3, 3, 2; 1 + 4, 4, 2; arranged on three rows	12, arranged on three rows [12 in series 3 digesti]	1 + 4, 3, 3; 1 + 3, 3, 3; 1 + 3, 3, 2	10–12; arranged on three rows
Organ of Tömösváry	not quoted	not quoted	equal in size to one of the smaller ocelli	smaller than the ocelli

.....continued

TABLE 11 (continued)

	<i>Lithobius agilis</i>	<i>Lithobius turritanus</i>		<i>Lithobius sardus</i>
Number of prosternal teeth	2+2	2+2	2+2	2+2 stout, somewhat spaced from one another
Median notch on the anterior margin of the prosternum	not quoted	not quoted	not quoted	rather deep
Porodont	not quoted	not quoted	not quoted	spiniform
Tergites 9, 11, 13	T. 9 with broad, blunt projections; those of TT. 11 and 13 with more prominent projections	angles of TT. 11 and 13 with posterior projections [scuta dorsalia 11, 13 angulis posticis productis]	posterior angles of T. 9 with much smaller projections than those of TT. 11 and 13	with triangular posterior projections rather long and pointed
Number and shape of coxal pores	3–5, usually 4, 4, 4, 3 or 4, 4, 4, 4; rounded	3, 3, 4, 2; oval [3, 3, 4, 2; ovales]	2, 3, 3, 3; 3, 3, 3, 3; small	2, 3, 3, 3; 2, 4, 4, 4; 3, 3, 4, 4; rounded, large
15 th accessory apical claw	well-developed	last pair of legs with a double claw [pedes anales unguibus binis]	well-developed	present
VaC	on 15 th leg only	not quoted	on 14 th and 15 th legs	on 15 th leg only
Leg 15	slightly thickened in both sexes	not quoted	not quoted	long and slender
Leg 15 spinulation	D: a, –, amp, p, –; V: a, m, amp, am, –	D: not quoted; V: *, m, amp, amp, a? [calcaribus 1+3+3+1 armati] * = not quoted, probably “a”	D: a, –, amp, p, –; V: a, m, amp, amp, –	D: a, –, amp, –, –; V: a, m, amp, am, a
Female gonopod	with 2+2 spurs rather long and slender but relatively broad at the base; claw tridentate with both dorsal and ventral denticles almost as large as the tip of the claw itself	claw simple, 3+3 spurs [unguis simplex calcaribus tria paria]	with three spurs and a single claw	with 2+2 conical spurs and wide claw without lateral denticles
Male genitalia	gonopod of a single article, second genital sternite without setae	not quoted	gonopod of a single article, second genital sternite without setae	not quoted

Remarks. *Lithobius sardus* was described as a subspecies of the European *L. agilis* C. L. Koch, 1847 on specimens from two caves of the Nuoro province, “Grotta S’Abb’ a Medica” and “Grotta Pisanu” (syntypes from “Grotta S’Abb’ a Medica” according to Manfredi 1976: 231), and most of the subsequent records come from cave localities of the same area (Grafitti 1990b; Grafitti & Zapparoli 1995). According to Manfredi (1956), *L. agilis agilis* and *L. a. sardus* differ in general body size, number of antennal articles, length of antennae, spinulation of the legs, shape of the 15th leg, and shape of the claw of the female gonopod. Minelli

(1983b) considers the taxonomic identity of *L. a. sardus* as uncertain and Eason (1975: 454) formerly suggests it as specifically distinct from *L. a. agilis*. The differences between the two forms (Tab. 11) seem sufficient to justify their separation into two species, in agreement with the former hypothesis of Eason (1975). The new taxonomic status is here therefore formalized (**status nov.**). The identity of *L. sardus* is, however, still not completely clear as, comparing the descriptions published and the material examined, this species appears morphologically close to *L. turritanus* Fanzago, 1881. Although the long and slender 15th leg seems to characterize *L. sardus* and differences can be found in the number of antennal articles, the length of the antennae, the shape of the triangular projections of TT. 9, 11 and 13, and in the number of spurs on the female gonopod (Tab. 11), the two taxa seem morphologically closely related. On the other hand, cave specimens of *L. sardus* with a smaller number of antennal articles (48, 51) and 3+3 spurs ("Grotta Su Tufu de Mangalistrù" 422 Sa/NU, 1 ♀; "Grotta Asutta 'e Scraccà" 5 Sa/NU, 1 ♀) have been here examined and epigeic specimens from the Nuoro province (especially from Gennargentu area, 600–1800 m a.s.l.), here referred to *L. turritanus* (see below) have female gonopods with 2+2 spurs and elongate 15th legs. The relationship between *L. sardus* and *L. turritanus* therefore deserves further investigation.

The epigeic records from Sassari province formerly published by Fanzago (1881b) under *L. macilentus* L. Koch, 1862 and then referred to *L. agilis* by Silvestri (1898), Verhoeff (1925a), Attems (1949) and De Miranda Restivo (1983), are unreliable and refer to *L. turritanus* (see below). The epigeic record from Macomer, Monte Sant'Antonio, Nuoro province, published by De Miranda Restivo (1982), is doubtful and probably also refers to *L. turritanus*. The record from Domusnovas, "Grotta di San Giovanni", Cagliari province, published by De Miranda Restivo (1983), is also doubtful and needs to be confirmed. The record under *L. macilentus* from Giave, published by De Miranda Restivo (1983), is erroneous and due to a misprint. The record from Villasalto, "Grotta 'e Scusi", Cagliari province, published by De Miranda Restivo (1983: 112) under *Lithobius sardous* Silvestri, 1898, is based on the same material later published as *L. (L.) a. sardus* Manfredi by Grafitti and Zapparoli (1995: 123).

FIGURES 15–16. Photos of Sardinian centipedes. **15.** Predation of *Lithobius sbordonii* Matic on *Alpioniscus fragilis* Budde-Lund (Crustacea, Isopoda, Trichoniscidae) in the cave of Su Molente near Codula Ilune (Nuoro province, without cadastre number) (photo by G. Dussoni, 17.III.2007). **16.** *Plutonium zwierleini* Cavanna in the cave “Nurra ‘e Pradu” Sa/NU 3083 (Nuoro province) (photo by L. Sanna, 9.XI.2008).

Material examined

Epigeic. No records.

Cave. Nuoro prov.: Baunei, Codula Ilune, “Grotta di Su Molente” without cadastre number, 40 m: 17.III.2007, 1 ex, photo by G. Dussoni; 8.IV.2007, MM, 1 ♀ (GSS). Dorgali, “Grotta Pisanu” 215 Sa/NU: 15.XI.1985, PG, 1 ex (TO*). Dorgali, “Grotta di Toddeitto” 89 Sa/NU, m 166: 12.X.1989, FG, 1 imm. ♂ (CFG). Lovettencannas, Supramonte di Baunei, “Grotta di Lovettencannas” 2642 Sa/NU, 930 m: 5.VI.2005, CO, 1 ♂ (GSS). Supramonte di Urzulei, Valle del Flumineddu, Zippiri ‘e Josso “Grotta di Mandara ‘e Suru Manna” 2489 Sa/NU, 870 m: 4.IV.2004, PM, 1 ♀ (GSS).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, S-European affinities.

Ecological notes. Highly specialized troglobitic species (Lewis 1981; Negrea & Minelli 1994), known only from caves of coastal Supramonte, Nuoro province, E-Sardinia, 40–930 m a.s.l. (10 sites). Predation on *Alpioniscus fragilis* Budde-Lund, 1909 (Crustacea Isopoda Trichoniscidae) has been observed (17.III.2007) in the cave of Su Molente without cadastre number, near Codula Ilune, Nuoro province (G. Dussoni and G. Grafitti com. pers.) (Fig. 15).

Remarks. *Lithobius (Troglobolithobius)* Matic, 1967 was erected to include *L. sbordonii* (type species by original designation, cf. also Shelley 2006) and two other highly specialized cave species, both from the west Balkans, *L. matulici* Verhoeff, 1899b and its possible synonym *L. sketi* Matic & Darabantu, 1968a (Verhoeff 1899b; Matic 1967; Matic & Darabantu 1968a). Kos (1992) noted the unclear systematic position of *Troglobolithobius* and Stoev (1997), considering it a non-monophyletic group, correctly synonymized this subgenus with *Lithobius* s. str. This synonymy, although accepted in the myriapodological literature (Zapparoli 2003; Zapparoli & Minelli 2005), has been overlooked in most of the subsequently published biospeleological papers on the Sardinian cave fauna, being *L. sbordonii* quoted under *Troglobolithobius* either at genus or subgenus rank (Grafitti 1999a, 2001a, 2002, 2007a; De Waele & Grafitti 2000; Lana et al. 2004; Casale et al. 2008). Included in the list of threatened invertebrate troglobitic species of Italy by Priano (1992). A history of the collections of this species in the Bue Marino cave, one of the most interesting in Sardinia from a biospeleological point of view, is summarized in Casale et al. (2008). The material from “Grotta di Mandara ‘e Suru Manna” 2489 Sa/NU is only tentatively identified, because the cave is out of the range of the species.

Other. Sassari prov.: “Sardegna, SS [=Sassari prov.], Tempio Pausania, 10.III.1968, R. Argano [leg.]”, 1 ♂, 1 ♀ without VaC 15th (CMZ*) [in De Miranda Restivo 1983: 114 under *Lithobius dentatus* Koch 1844]. Cagliari prov.: “*Lithobius oligoporos*, Latz./Burcei”, 3 ♀♀ (one female with 3+2 spurs on gonopods, VaC 15th present but asymmetric in one specimen [in Silvestri 1898: 682 under *Lithobius* (s. s.) *oligoporos*] (MGE).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities (?).

Ecological notes. 0–1300 m; one of the most common Sardinian Lithobiidae; thermophilous species mostly found in oakwoods (*Quercus ilex*, 18 sites; *Quercus* sp., 1 site) but also in open and shrub Mediterranean habitats (garrigue, 4 sites; maquis, 2 sites; *Pistacia lentiscus*, 1 site; *Erica arborea* and *Arbutus unedo*, 1 site; generic records from habitats not obviously distinct from one another, such as meadows, 2 sites, and open habitats, 1 site, are also known); two records from riparian habitats, including under *Alnus* sp. (1 site); in montane formations (*Juniperus* sp. shrubs, 1 site); in pine plantations (3 sites including *Tamarix* and *Pinus halepensis* plantations, 1 site); in agricultural habitats (walnut orchards, 2 sites; cherry orchards, 1 site; vineyards, 1 site); in *Eucalyptus* sp. plantations (1 site); sometimes in caves (5 sites, 206–320 m; troglobi species). Six records from endogeous habitats. See also De Miranda Restivo (1982, 1986), Minelli (1983a) and Minelli and Iovane (1987).

Remarks. The identity of the Sardinian records wholly or at least partly published under *Lithobius alpicosiensis* Matic, 1973, *L. dentatus* C. L. Koch, 1844, *L. fanzagoi* Fedrizzi, 1876a, *L. fraleiae* De Miranda Restivo, 1978, *L. microdon* Latzel, 1886, *L. oligoporos* Latzel, 1885, *L. piceus* L. Koch, 1862, *L. tricuspidis* Meinert, 1872, *L. tricuspidis mononyx* Latzel, 1888 and *L. turritanus* Fanzago, 1881b is uncertain. Most of them are due to misidentifications and have been acritically repeated by the authors (*L. alpicosiensis*, *L. dentatus*, *L. fanzagoi*, *L. microdon*, *L. piceus*, *L. tricuspidis*, *L. tricuspidis mononyx*), others are related to species the taxonomic identity of which is unclear (*L. turritanus*, *L. oligoporos*, *L. fraleiae*). Likely, they all refer to a same very common and quite variable taxon, probably endemic to Sardinia (or to Corsica and Sardinia), the correct name of which should be *L. turritanus*, and the most modern and complete description of which – well corresponding to the material here examined – has been provided by Eason (1980) under *L. tricuspidis*, a Central European species the presence of which in Sardinia is uncertain in spite of the numerous records.

Lithobius turritanus was described by Fanzago (1881b) on specimens from the Sassari province. Eason and Minelli (1976) suggested it as a possible senior synonym of *L. microdon* Latzel, 1886, from Spain and Morocco (Brölemann 1932), but they did not make a formal synonymy pending the re-examination of type or Sardinian specimens. Eason (1980) later rejected this early hypothesis and formally proposed *L. turritanus* as a junior synonym of *L. tricuspidis*. This identity has become established because the relatively small size of the posterior triangular projections of tergites 9, 11 and 13 found in the Sardinian specimens, particularly the projections of T. 9, falls within the variation range of French populations of *L. tricuspidis*, as described by Brölemann (1930). However, as Eason (1980) emphasized, such variation has not been recorded in English populations of this species, where only prominent projections are present (Eason 1965), and even *L. tricuspidis* from Austria and mainland Italy do not show the pattern described by Brölemann (1930), having only prominent projections as well (Latzel 1880; Koren 1992; Zapparoli unpublished). This lead to the doubt that Brölemann's (1930) description may be composite and based on other species of *Lithobius* besides *L. tricuspidis* (e.g. *L. acuminatus* Brölemann, 1892), thus leading Eason (1980) to a wrong conclusion. Eason (1980) also noticed some constant differences between his Sardinian specimens and French (Brölemann 1930) and English (Eason 1965) populations of *L. tricuspidis*, such as in the presence of a VpP spine on 1st–2nd to 15th legs and in the absence of a 15th VaTi spine. The spinulation of Sardinian specimens examined by Eason (1980) differs from that of Austrian populations of *L. tricuspidis* in the same way (see Koren 1992). Other strong differences not explicitly highlighted by Eason (1980) are to be found in the shape of the claw of female gonopods, being unidentate in the Sardinian specimens and tridentate in the populations from England and continental Europe (Brölemann 1930; Eason 1965; Koren 1992; Zapparoli unpublished); females with a unidentate claw seem however to occur in France (Brölemann 1930: fig. 426). Significant differences also apparently exist in habitat preferences, *L. turritanus* being mostly thermophilous, while *L. tricuspidis* is chiefly related to mesophilous woodlands (see Barber 1985; Minelli & Iovane 1987; Koren 1992; Zapparoli 2006), although records from Mediterranean forest habitats are also known (Serra & Miquel 2003). Eason's (1980) synonymy of *L. turritanus* with *L. tricuspidis* is therefore unconvincing and is here rejected.

Lithobius oligoporos was described on a male specimen from Desulo (Nuoro) (Latzel 1884). The same description was again published one year later (Latzel 1885), therefore *Lithobius oligoporos* Latzel, 1884 =

Lithobius oligoporus Latzel, 1885, **syn. nov.** Although scanty, the original description of this species agrees well with the original description of *L. turritanus* and with the description of *L. tricuspidis* given by Eason (1980). *Lithobius oligoporus* apparently differs only in the presence of two ventral spines in the 15th femur and the absence of the 15th accessory apical claw. However, these supposed differences are likely due to erroneous observation, as in the 65 mature and not mutilated specimens (31 males, 34 females) of the material here examined, VaF and VpF 15th are only occasionally absent (see also Eason 1980) and the 15th accessory apical claw is absent only in the left leg of an asymmetrical female from “Grotta di San Giovanni” (CNBFVR). Silvestri (1898) quoted and redescribed *L. oligoporus* on specimens from Burcei (Cagliari); according to Eason (1980) this record is uncertain and was tentatively referred to *L. tricuspidis* as the ventral spinulation of the 15th femur is quite different from the pattern usually found in Sardinian specimens. The specimens studied by Silvestri (1898) have been here re-examined and the spinulation pattern found is the same given in Eason (1980) for *L. tricuspidis*. All the published records of *L. oligoporus* must be therefore referred to *L. turritanus*.

Lithobius fraleiae was established by De Miranda Restivo (1978) on specimens from Monte dei Sette Fratelli (Cagliari prov.) without giving a complete description but only some comparative remarks with respect to *L. tricuspidis*. Although not explicitly affirmed and without formalizing its identity, it seems almost clear that in a subsequent paper the same author assigned the same material to *L. tricuspidis* (De Miranda Restivo 1986).

Although the type specimens of *Lithobius turritanus*, *Lithobius oligoporus* and *Lithobius fraleiae* have not been examined, after the examination of a large collection of specimens from Sardinia, the following new synonymies are proposed: *Lithobius oligoporus* Latzel, 1884 = *Lithobius turritanus* Fanzago, 1881b **syn. nov.** and *Lithobius fraleiae* De Miranda Restivo, 1978 = *Lithobius turritanus* Fanzago, 1881b **syn. nov.**

The record of *L. fanzagoi* quoted by Fanzago (1881b) from the neighbourhood of Sassari and then referred to *L. piceus* – a south European species not present in Sardinia – by Silvestri (1898) is here tentatively assigned partly to *L. turritanus*. The description given by Fanzago (1881b) seems composite, maybe based on specimens both of *L. turritanus* and *Lithobius* sp., probably *L. castaneus* (see above). Silvestri (1898) quoted *L. piceus* also from Burcei; although it has not been possible to re-examine the material, this record probably refers to misidentified specimens of *L. turritanus*.

Lithobius turritanus seems closely related to a group of species distributed in the W-Mediterranean area, including some more or less thermophilous taxa such as *L. acuminatus* Brölemann, 1892 from southern France, north-west Italy, also quoted from Corsica (Léger & Duboscq 1903; Brölemann 1930; Iorio 2008) but the record needs confirming, *L. cassinensis* Verhoeff, 1925b, from Peninsular Italy, Tuscan Archipelago, Pontine Isl., Ischia Is., Capri Is. (see Eason 1983), also quoted from Corsica (Verhoeff 1943d) but the record needs confirming, and *L. trinacrius* Verhoeff, 1925b (= *L. sicilianus* Matic & Darabantu, 1968b, see Zapparoli 1995; Zapparoli *et al.* 2004) from Sicily, Egadi Isl., Pantelleria Is., Lampedusa Is. and Malta Is. Apparently related to *L. turritanus* are also some taxa of doubtful identity from Corsica, such as *L. blanchardi* Léger & Duboscq, 1903, *L. aidonensis aidonensis* Verhoeff, 1943d and *L. a. valdoniellensis* Verhoeff, 1943d (Léger & Duboscq 1903; Brölemann 1930; Verhoeff 1943d), as well as *L. microdon* Latzel, 1886 (North Africa) and *L. clarki* Eason, 1975 (Balearic Isl.), a subspecies of *L. microdon* according to Serra (1986) (see also Zapparoli 1984, 1995). In this group should be included also *L. alpicosiensis* from NW Italy – a synonym of *L. tricuspidis* according to Iorio (2008) – the habitat preferences of which, however, are more mesophilous.

Although some differences in morphological characters have been recorded such as the number of antennal articles, the length of antennae, the shape of the triangular projections of TT. 9, 11 and 13, the number of spurs of the female gonopod, and the shape of the 15th leg, *L. turritanus* seems also close to *L. sardus* (Tab. 11), a species recorded only in caves of the Nuoro province, originally described as a subspecies of *L. agilis* and here raised to species rank (see above). Indeed, in the material examined, specimens with a high number of antennal articles (53) and elongate 15th leg, as in *L. sardus*, have been observed, albeit occasionally. Moreover, mature females from the Gennargentu area, Nuoro province, show almost regularly gonopods with 2+2 spurs, again as in *L. sardus*, whereas in other Sardinian areas mature females with 2+2 spurs, or other arrangements as well, such as 2+3 or 4+3 spurs, only occasionally occur. Thus, the relationships between the two taxa clearly deserve further investigation.

Notes on the variation of the number of prosternal teeth, spurs of gonopods and on 15th leg spinulation of the present specimens are given in the material examined.

The epigeic records published by Fanzago (1881b) under *L. macilentus* from Sassari province and then referred to *L. agilis* by Silvestri (1898), Verhoeff (1925a) and De Miranda Restivo (1983) are here referred to *L. turritanus* as they show the same characters as this species and the collecting sites correspond (see Fanzago 1881b: 4, 6).

Villacidro, Punta Fenu, 225 m, 32S 0471850 4356980, under stones: 11.XI.2006, GN, 1 imm. ♀ (CNBFVR).

Cave. Oristano prov.: Tegas, Cuglieri, “Grotta di Cappas” 181 Sa/OR, 197 m, under stone, in the main branch, 50 m from entrance: 5.XI.2005, GG, 1 ♂ (GSS) [in Grafitti 2007b: 223 under *Lithobius* sp.].

General distribution. The distribution of this species is still not satisfactorily detailed, owing to the confusion with *L. microps* Meinert, 1868 by the most Authors (*cf.* Eason 1974); it includes Albania, France (?), Greece (mainland, insular including Crete), Italy (mainland, Sicily, Sardinia), Montenegro (?), Romania, the Russian Plain (= a vast area covering most of the European part of the former Soviet Union, *cf.* Zalesskaja & Golovatch, 1996), Slovenia, ex Yugoslavia [Bosnia and Herzegovina, Croatia, Serbia], Turkey.

Chorotype. S-European.

Ecological notes. 100–1300 m; in *Quercus ilex* woods (4 sites), in riparian habitats (under *Populus* sp., 1 site; *Alnus* sp., 1 site); in garrigue (1 site) and maquis (1 site); also in caves (8 sites, 180–430 m; troglobiont species). See also De Miranda Restivo (1986).

Remarks. Records of *Monotarsobius microps* (Meinert, 1868) published by De Miranda Restivo (1983, 1986) are here referred to this species following Eason (1974) and Foddai *et al.* (1995). Records of *Monotarsobius tamaninii* Manfredi, 1948 from the “Grotta di San Giovanni” 81 Sa/CA published by De Miranda Restivo and Guaita (1986) are here tentatively referred to this species according to Foddai *et al.* (1995). Records under *Monotarsobius microps* published by De Miranda Restivo (1983) partly refer also to *L. lapidicola* (see above).

The unidentified *Lithobius* sp. from Tegas, Cuglieri, “Grotta di Cappas” 181 Sa/OR quoted by Grafitti (2007b) has been here examined and belongs to this species.

- 13) Lithobiidae indet.: Grafitti 2007c: 69.

Literature records

General. Sardinia (9).

Epigeic. No records.

Cave. Sassari prov.: Mara, “Grotta Sa Ucca de Filiestru” 179 Sa/SS (8, 13). Romana, “Sa Grutta de Santu Giagu” 260 Sa/SS (6). San Pietro di Sorres, Borutta, “Grotta Sa Rocca Ulari” 257 Sa/SS, 485 m (5). Nuoro prov.: Baunei, “Grotta di Mesu ‘e Monte” without cadastre number (12). Baunei, “Grotta Nurra Genna S’Armentu” 421 Sa/NU (4, 11). Baunei, “Grotta Nurra Su Lenzonargiu” [or “Nurra de Su Lenzonargiu”] 447 Sa/NU (3, 12). Perdasdefogu, “Grotta de Su Fenugu” 1935 Sa/NU (10). Urzulei, “Grutta de Monte Longos” or “Gotta Su Spiria” (12). Supramonte di Baunei, Codula Ilune, “Grotta di Monte Longos o Su Spiria” 1988 Sa/

NU (7). Cagliari prov.: Fluminimaggiore, “Grotta di San Pietro” 605 Sa/CA (1, 2). Fluminimaggiore, “Grotta di Su Mannau” 97 Sa/CA (1, 2).

Remarks. Quotations based on immature or mutilated specimens or on materials of uncertain identity. Most of these records probably belong to epigaeic *Lithobius* species. The capture of a 6 cm long, blind and depigmented lithobiid centipede in the cave “Su Mannau” mentioned by Sanna *et al.* (1972: 100) and repeated by Rivalta (1982) requires confirmation.

The quotation of Lithobiomorpha by Grafitti (1989, 2007a) and De Waele and Grafitti (2004) almost certainly refer to species of Lithobiidae.

Order SCOLOPENDROMORPHA Pocock, 1895

Cryptopidae Kohlrausch, 1881

Cryptops Leach, 1815

Subgenus *Cryptops* Leach, 1815

21. *Cryptops (Cryptops) hortensis* (Donovan, 1810)

- 1) ? *Cryptops hortensis* Leach: Silvestri 1898: 684 [pars].
- 2) ? *Cryptops hortensis* Leach: Verhoeff 1925a: 655 [pars].

- 10) *Cryptops hortensis* Leach, 1815: Zapparoli & Minelli 2005: CD [pars].

Literature records

General. Sardinia-Corsica (4). Sardinia (2, 3, 6, 8).

Epigaeic. Nuoro prov.: Macomer, Monte Sant’Antonio, *Quercus ilex* wood (5). Cagliari prov.: Cagliari (1).

Cave. Sassari prov.: Pozzomaggiore, Valley of Androliga, “Grotta Androliga” 142 Sa/SS (7, 9, 10).

Material examined

Epigaeic. Oristano prov.: Asuni: 29.III.2007, AC, 1 ex (CMZ).

Cave. No records.

General distribution. Europe: Albania, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Denmark (mainland), Finland, France (mainland, Corsica), Germany, Great Britain, Greece (mainland, insular including Crete), Hungary, Iceland, Ireland, Italy (mainland, Sicily, Sardinia), Republic of Macedonia, Montenegro, Norway, Poland, Portugal (mainland, Azores Isl., Madeira Is.), Romania, Russia (European), Slovak Republic, Slovenia, Spain (mainland, Canary Isl.), Switzerland, Sweden, The Netherlands, Ukraine; North Africa: Morocco; West Asia: Armenia, Azerbaijan, Georgia, Turkey (northern), Tadzhikistan, Turkmenistan, Uzbekistan; North America: Canada (introduced), USA (introduced); Atlantic islands: St. Elena Is. (introduced); Pacific islands: Hawaii Isl. (introduced).

Chorotype. Centralasiatic-European.

Ecological notes. No data on elevation range; one record from *Quercus ilex* wood; found also in caves (1 site; troglobene species). See also De Miranda Restivo (1982).

Remarks. Records from Sardinia (Cagliari and Flumentorgiu) published by Silvestri (1898), then copied by Verhoeff (1925a), Attems (1949) and Minelli (1978a), have been partly (Flumentorgiu) re-examined and must be referred partly to *C. punicus* Silvestri, 1896a, partly to *C. trisulcatus* Brölemann, 1902 (see below). Subgeneric assignment according to Attems (1930).

Cave. Nuoro prov.: Galtelli, Monte Tuttavista, Tres Puntas, “Pozzo N. 2 di Tres Puntas” 1151 Sa/NU, 750 m: 16.III.2008, PM, 1 ex (CMZ).

Other. Cagliari prov.: “*Cryptops hortensis* Leach/Flumentorgiu/(Sardegna) V-1894/Solari [leg.]”, “*Cryptops hortensis* Leach/Flumentorgiu (Sardegna)/Maggio [= May] 1894 Solari”, 2 imm. together with 1 ex of *C. trisulcatus* [in Silvestri 1898: 684 under *Cryptops hortensis* Leach] (MGE).

General distribution. Europe: Italy (Montecristo Is., Sardinia, Sicily and circumsicilian islands); North Africa: Algeria, Tunisia, Libya (Silvestri 1896a; Zapparoli and Minelli 2005; Akkari *et al.* 2008).

Chorotype. W-Mediterranean.

Ecological notes. 0–1400 m; the few records available are from Mediterranean habitats (*Pistacia lentiscus*, 1 site; garrigue, 1 site); occasionally in caves (2 sites, 500–750 m; trogloxene species). Three records from endogeous habitats. See also Minelli (1983a).

Remarks. Part of the records from Sardinia published by Silvestri (1898) under “*Cryptops hortensis* Leach” (three specimens from Flumentorgiu) have been re-examined and must be referred partly to this species, partly to *Cryptops trisulcatus* Brölemann, 1902 (see below). Generic quotations of *C. hortensis* from Sardinia published by Verhoeff (1925a), Attems (1949) and Minelli (1978a) probably derive from Silvestri’s (1898) records and must be, at least partly, assigned to this species. Subgeneric assignment according to Akkari *et al.* (2008).

General distribution. Europe: France (mainland, Corsica), Greece (Ionian Isl., Southern Sporades, Crete), Italy (mainland, Sicily, Sardinia), Maltese Archipelago, Portugal (mainland), Romania, Spain (mainland, Balearic Isl., Canary Isl.); North Africa: Algeria, Tunisia; West Asia: Turkey (south-east) (Zapparoli 2002; Zapparoli *et al.* 2004; Akkari *et al.* 2008).

Chorotype. Mediterranean.

Ecological notes. 0–1300 m; in open Mediterranean habitats, including maquis with *Erica arborea* and *Arbutus unedo* (1 site), *Pistacia lentiscus* (1 site) and garrigue (2 sites); also in oakwoods (*Quercus ilex*, 3 sites; *Q. pubescens*, 1 site; *Q. suber*, 1 site); in riparian habitats (under *Alnus* sp., 1 site); rarely in caves (2 sites, 370–1040 m; trogloxene species). Five records from endogeous habitats. See also Minelli (1983a) and Minelli and Iovane (1987).

Remarks. Silvestri's (1898) records of *C. anomalans* Newport, 1844 from Sardinia have been considered of uncertain identity by Minelli (1983b). However, they should be based on misidentified specimens of *C. trisulcatus*, maybe mistaken because of the broad resemblance in the arrangement of the sutures on tergite 1 of both species. Accordingly with this tentative interpretation, also the subsequent Sardinian generic quotations of *C. anomalans* published by Verhoeff (1925a, as *C. punctatus* C.L. Koch, 1847), Attems (1930, 1949) and Minelli (1978a), must be at least partly listed under *C. trisulcatus* (see also remarks on *C. breviunguis*). Part of the records from Sardinia published by Silvestri (1898) under "*Cryptops hortensis* Leach" (three specimens from Flumentorgiu) have been re-examined and must be referred partly to this species, partly to *Cryptops punicus* (see above). Subgeneric assignment according to Attems (1930).

24. *Cryptops* (*Cryptops*) sp. A

1) *Cryptops* sp.: Lana *et al.* 2007: 43.

Literature records

Cave. Nuoro prov.: Baunei, [Codula di Sisine], "Grotta Su Tufu de Mangalistru" 422 Sa/NU, [320 m] (1).

Material examined

Epigeic. No records.

Cave. Nuoro prov.: Baunei, Codula di Sisine, "Grotta Su Tufu de Mangalistru" 422 Sa/NU, 320 m: 17.VIII.2002, MP, 1 ex (CMZ).

General distribution. Europe: Italy (Sardinia).

Chorotype. Endemic, W-Mediterranean affinities.

Remarks. The specimen examined belongs to an undescribed troglobitic species still under study.

Cryptops (Cryptops) spp.

- 1) *Cryptops* spp.: A. Costa 1884d: 48.
- 2) *Cryptops* sp.: De Miranda Restivo 1982: 174.

Literature records

General. Sardinia (1§).

Epigeic. Nuoro prov.: Dorgali, Rio Flumineddu, under *Alnus* sp. and *Nerium oleander* (2).

Remarks. Quotations based on mutilated specimens or on materials of uncertain identity probably belonging to *C. hortensis*, *C. punicus* or *C. trisulcatus*, the sole species of the genus occurring in Sardinia.

Plutoniumidae Bollman, 1893b

Literature records

General. Sardinia-Corsica (13). Sardinia (5, 7, 8, 9, 10, 12, 14, 15, 16, 17, 18, 19).

Epigeic. Sassari prov.: Lanusei (12, 19, 20). Sassari (21). Nuoro prov.: Aritzo (20). Desulo (1, 2, 3, 4, 6, 20). Oristano prov.: Asuni [emendation for Assuni] (19). Cagliari prov.: Sarrabus [area] (4, 6, 20).

Cave. No records.

Material examined

Epigaeic. Nuoro prov.: Aritzo, surroundings: 26.V.1909, leg ?, 1 ex (CMZ*). Cagliari prov.: Esterzili: near houses, V.2003, IC & FF, 1 ex (CCA).

Cave. Nuoro prov.: Oliena, Supramonte di Oliena, cave “Nurra ‘e Pradu” Sa/NU 3083, 1220 m, in the small pit near the entrance (- 4 m): 9.XI.2008, L. Sanna vidit, 1 ex. Oliena, Cannagosula, “Grotta Su Guanu” or “Grotta del Guano” 103 Sa/NU, 95 m, in the second hall: IX.1960, CR, 1 ex 120 mm long (from the anterior margin of the head shield to the posterior end of the last pediferous segment) (GGNU).

Other. Cagliari prov.: “*Plutonium Zwierleini*, Cav./Sardegna: Sarrabus/G.B. Traverso [leg.]”, “Sardegna/(Sarrabus)/G.B. Traverso [leg.] 1878”, 1 ex 70 mm long [in Silvestri 1898: 685] (MGE). “*Plutonium Zwierleini*, Cav./Sardegna: Sarrabus/G.B. Traverso [leg.]”, “Sardegna/Sarrabus/G.B. Traverso [leg.] 1880”, 1 ex 84 mm long [in Silvestri 1898: 685] (MGE).

General distribution. Europe: Italy (southern regions, Sicily, Sardinia), Spain (mainland) (Würmli 1975; Minelli 1984; Shelley 1997).

Chorotype. W-Mediterranean.

Ecological notes. 95–1220 m; no detailed records are available on the habitat of the epigaeic populations of this species but the quotation from Desulo by Costa (1884d: “tra le macerie del paese” [= among the rubble of the village]) and the original record from Esterzili (near houses) suggest some tolerance for disturbed environments; two apparently unusual records from caves are also known (95 m and 1220 m a.s.l., respectively; troglobiont species). See also Würmli (1975) and Minelli and Iovane (1987).

Remarks. Two of the three specimens of this species recorded by Silvestri (1898) from Sarrabus have been re-examined and their identification is confirmed. The record from cave “Nurra ‘e Pradu”, Oliena, was identified based on photo by L. Sanna (Gruppo Speleologico Sassarese) (Fig. 16).

(IEASS); 30.VII.2003, FS, 1 ex (IEASS). Province? “Monte Nuovo (Sardegna)”: 1873, RG, 10 exx “*Scolopendra clavipes* C. Koch F. Silvestri det. (MGE).

Cave. No records.

Other. Cagliari prov.: “Isola Vacca sett. [= September] 1875/”Violante”/S. *dalmatica*—Koch/Pir. Ann. Mus. Civ. Gen. XI. p. 405”, 2 exx [in Pirotta (1878): 405, as *Scolopendra dalmatica* Koch] (MGE). “*Scolopendra/dalmatica* Koch/Cala Salinas (Sardegna)/IX–1876 “Violante” ”, “*Scolopendra dalmatica* Koch/Pirotta Ann. Mus. Civ. Gen. XI. p. 405/Cala Salinas (Sardegna) Nov. 1876 “Violante” ”, 2 exx [in Pirotta 1878: 405, as *Scolopendra dalmatica* Koch] (MGE). “*Scolopendra clavipes*, C. Koch/Cagliari”, 3 exx [in Silvestri 1898: 684, as *Scolopendra clavipes* C. Koch] (MGE).

General distribution. Europe: France (Corsica), Italy (mainland, Sicily, Sardinia), Malta, Portugal (mainland), Spain (mainland, Balearic Isl.); North Africa: Algeria, Morocco (Würmli 1980; Lewis 1985).

Chorotype. W-Mediterranean.

Ecological notes. 0–1400 m; mostly in open Mediterranean habitats, under *Pistacia lentiscus* (1 site), in garrigue (1 site) and other open habitats (2 sites), also on beaches (1 site) and in riparian habitats (*Alnus* sp. and *Nerium oleander*, 1 site); sometimes in oakwoods such as *Quercus ilex* (1 site), *Q. suber* (2 sites), *Q. pubescens* (1 site), *Quercus* sp. (1 site) woods, as well as in *Eucalyptus* sp. plantations (1 site) and agricultural habitats (vineyards, 2 sites); exceptionally in caves (1 site, 1040 m; trogloxene species). Three records from endogeous habitats. See also De Miranda Restivo (1982), Minelli (1983a) and Minelli and Iovane (1987).

Remarks. The records of *Scolopendra dalmatica* C.L. Koch, 1847 published by Pirotta (1878) from Sardinia have been re-examined and must be assigned to this species. The other 19th century literature records of *S. dalmatica*, as well as those of *S. clavipes* C. L. Koch, 1847, are here referred to this species according to Würmli (1980). The specimens from stomachs of Sardinian wild boars (*Sus scrofa meridionalis* Forsyth Major) identified by Pinna *et al.* (2007) as *S. cingulata* Latreille, 1829 – a Mediterranean species absent from Sardinia (e.g., Zapparoli & Minelli 2005; Simaiakis & Mylonas 2008) – probably also belong to this species.

Order GEOPHILOMORPHA Pocock, 1895

Villasimius, soil washing and Berlese extraction: 22.III.2008, LF, 1 ex (CMZ).

Cave. No records.

Other. Nuoro prov.: “*Himantarium rugulosum* (C. Koch)/ [Gairo] Taquisara (Sardegna)”, 2 exx [in Silvestri 1898: 685, as *Himantarium rugulosum* C. Koch] (MGE).

General distribution. Europe: Albania, Bosnia and Herzegovina, Bulgaria, Croatia, France (mainland, Corsica), Greece (mainland, insular excluding Crete), Italy (mainland, Sicily, Sardinia), Republic of Macedonia, Montenegro, Romania (southern), Slovenia, quoted from Portugal by Attems (1929) but not by Machado (1952), also in Central Europe according to Brölemann (1930); North Africa: Algeria, Morocco, Tunisia; Austral Africa: Madagascar (?), introduced (Lawrence 1960); West Asia: Turkey (western).

Chorotype. Mediterranean.

Ecological notes. 0–1200 m; mostly in oakwoods (*Quercus ilex*, 6 sites; *Q. pubescens*, 1 site; *Q. suber*, 1 site); under *Erica arborea* and *Arbutus unedo* (1 site), in *Eucalyptus* sp. plantations (1 site); also in caves (5 sites, 20–485 m; troglobene species). Ten records from endogeous habitats.

Remarks. Part of the records from Sardinia published by Silvestri (1898) as *Himantarium rugulosum* C. L. Koch, 1841 (2 specimens from Gairo Taquisara) have been re-examined and must be assigned this species. Other records of *H. rugulosum* and *H. mediterraneum* (Meinert, 1870) refer to this species according to Minelli *et al.* (1984). Minelli *et al.* (1984) give 101–165 for males and 107–177 for females as variation of the pediferous segments for this species in Sardinia.

***Stigmatogaster* Latzel, 1880**

28. *Stigmatogaster gracilis* (Meinert, 1870)

- 1) *Geophilus laevipes* C. K.: Fanzago 1881b: 15.
- 2) *Stigmatogaster gracilis* Mein. [sic]: A. Costa 1885: 9.
- 3) *Stigmatogaster gracilis* (Mein.): Silvestri 1898: 685.

- 4) *Diadenoschisma gracile* Mein. [sic]: Verhoeff 1925a: 656.
- 5) *Stigmatogaster gracilis provincialis* Chal. & Rib.: Attems 1929: 39.
- 6) *Stigmatogaster gracilis* (Meinert, 1870): Minelli 1978a: 156.
- 7) *Stigmatogaster gracilis* (Meinert): De Miranda Restivo 1982: 173.
- 8) *Stigmatogaster gracilis*: Baccetti 1983: 862.

Cave. No records.

Other. Nuoro prov.: “*Stigmatogaster gracilis* Mein./[Gairo] Taquisara (Sardegna)”, 1 ex [in Silvestri 1898: 685] (MGE). Cagliari prov.: “*Stigmatogaster gracilis* Mein./Flumentorgiu (Sardegna)/Maggio [= May] 1894 Solari [leg.]”, “*Stigmatogaster/gracilis* Mein./Flumentorgiu/V–1894/Sardegna”, 1 ex [in Silvestri 1898: 685] (MGE).

General distribution. Europe: Albania, Croatia, France (mainland, Corsica), Greece (mainland, insular excluding Crete), Italy (mainland, Sicily, Sardinia), Montenegro, Spain (Balearic Isl.); North Africa: Algeria, Tunisia.

Chorotype. Mediterranean.

Ecological notes. 0–1250 m; mostly in oakwoods (*Quercus ilex*, 12 sites; *Q. suber*, 2 sites; *Q. pubescens*, 1 site; *Quercus* sp., 1 site) but also in open and shrubby Mediterranean habitats (*Pistacia lentiscus*, 3 sites; *Cistus monspeliensis*, 1 site; *Erica arborea* and *Arbutus unedo*, 1 site; generic quotations from meadows, 2 sites, are also known); no records from caves. Thirty-five records from endogeous habitats. See also De Miranda Restivo (1982), Minelli (1983a) and Minelli and Iovane (1987).

Remarks. The records of *Geophilus laevipes* (C. L. Koch, 1847) and *Stigmatogaster gracilis provincialis* Chalande & Ribaut, 1909, quoted in Fanzago (1881b) and Attems (1929), respectively, refer to this species according Minelli and Bonato (in press). Part of the records from Sardinia published by Silvestri (1898) under this species (two specimens from Gairo Taquisara and Flumentorgiu, respectively) have been re-examined and their identification is confirmed.

29. *Stigmatogaster sardoa* (Verhoeff, 1901)

- 1) *Haplophilus sardous* Verhoeff 1901: 411, tav. 17, figs 7, 8.

- 28) *Stigmatogaster dimidiatus sardous* Verhoeff, 1901 [sic]: Grafitti & Merella 2008: 86, 93.

Literature records

General. Sardinia-Corsica (12). Sardinia (type locality of *Haplophilus sardous* Verhoeff, 1901) (1§, 2, 3, 4, 5, 6, 13, 14, 15, 17, 21, 22, 23).

Epigeic. Nuoro prov.: Lago di Gusana, mosses and humus near the lake (16, 27).

Cave. Nuoro prov.: Dorgali [generic quotation for the caves of the area] (25). Dorgali, Monte Coazza [generic quotation for the caves of the area] (20). Dorgali, Monte Coazza, “Grotta Pisanu” 215 Sa/NU (type locality of *Stigmatogaster sardoa dorgalina* Manfredi, 1956) (7, 8, 9, 10, 11, 18, 26, 27). Cagliari prov.: Iglesias, “Grotta VI di Monte Figu” 637 Sa/CA (19). Iglesias, Corongiu de Mari, “Grotta della Sbarra” 1009 Sa/CA [= 1009 Sa/CI] (24, 28). Iglesias, Corongiu de Mari, “Grotta del Cancello” 1423 SA/CI (24, 28).

Material examined

Epigeic. Sassari prov.: Romana, Rio Melas, soil washing and Berlese extraction: 23.XII.2006, LF, 1 ex (CMZ). Nuoro prov.: Gennargentu, Monte Cresia: I.1899, GD, 2 ♂♂ 97-99 lp, 2 ♀♀ 97-99 lp (MGE). Cagliari prov.: Arbus, in the village, soil washing and Berlese extraction: 2.X.2006, LF, 2 exx 121 lp (CMZ). Domusnovas, near Gutturu Abis, 580 m, 32S 0468140 4360761, under stones: 10.XI.2006, GN, 1 ♂ 119 lp (CMZ). Iglesias, soil washing and Berlese extraction: 16.VI.2003, LF, 1 ex (CMZ); 10.II.2008, LF, 2 exx (CMZ). Nuxis, Campanasissa, soil washing and Berlese extraction: 27.XII.2006, LF, 2 exx 121 lp (CMZ). San Vito, Monte Lora, soil washing and Berlese extraction: 19.XII.2006, LF, 1 ex (CMZ).

Cave. Nuoro prov.: Galtelli, Monte Tuttavista, Tres Puntas, “Pozzo N. 2 di Tres Puntas” 1151 Sa/NU, 750 m: 16.III.2008, PM, 1 ♀ 127 lp (CMZ). Ulassai, Truculu, “Grotta di Is Lianas” or “Sa Rutt'e Noa” or “Grotta Truculu” 193 Sa/NU, 905 m: 1995, GG, 1 f # 129 lp (CMZ).

General distribution. Europe: Italy (Sardinia).

Chorotype. Sardinian endemic, W-Mediterranean affinities (?).

Ecological notes. No detailed records on elevation range, but one site at 580 m a.s.l.; epigeic (3 sites) but also in caves (6 sites, 905–750 m; trogloxene species). Six records from endogeous habitats.

Remarks. Taxonomic status according to Minelli and Bonato (in press). The record of *Haplophilus subterraneus* (Shaw, 1789) [not Leach] from Iglesias, “Grotta VI di Monte Figu”, Cagliari province, quoted by De Miranda Restivo and Guaita (1986), is probably due to misdetermination and should refer to this species. The generic quotation of unidentified Geophilidae published by Grafitti and De Waele (1996) and those of *Stigmatogaster dimidiatus sardous* published by Grafitti and Merella (2008), both from Iglesias, Corongiu de Mari, “Grotta della Sbarra” 1009 Sa/CA, and Iglesias, Corongiu de Mari, “Grotta del Cancello” 1423 SA/CI, refer to the same material.

30. *Stigmatogaster superba* (Meinert, 1870)

- 1) *Meinertophilus superbus* (Mein.): Silvestri 1898: 685.
- 2) *Himantarium superbum* Mein.: Attems 1903: 175.
- 3) *Meinertophilus superbus* Mein. [sic]: Verhoeff 1925a: 656.
- 4) *Haplophilus superbus*: Brölemann 1926b: 231.
- 5) *Meinertophilus superbus* (Mein.): Attems 1929: 43, figs 58, 59.
- 6) *Haplophilus superbus* (Meinert, 1870): Minelli 1978a: 156.
- 7) *Meinertophilus supernus* [sic]: Baccetti 1983: 862.
- 8) *Meinertophilus superbus* (Meinert, 1870): Minelli 1983a: 2.
- 9) *Meinertophilus superbus* (Mein. 1870): Minelli 1983b: 405.

- 10) *Stigmatogaster superbus* (Meinert, 1870): Foddai *et al.* 1995: 8.
- 11) *Stigmatogaster superbus* (Meinert, 1870): Foddai *et al.* 1996: 361, tab. I.
- 12) *Stigmatogaster superbus* (Meinert, 1870): Zapparoli & Minelli 2005: CD.

Literature records

General. Sardinia-Corsica (6). Sardinia (2, 3, 4, 5, 7, 9, 10, 11).

Epigeic. Nuoro prov.: Gavoi, 3 km N (8, 12). Sarule, 2 km SSE, 650 m (8, 12). Cagliari prov.: Domusnovas (8, 12). Sarrabus [area] (1, 12).

Cave. No records.

Material examined

Epigeic. No records.

Cave. No records.

Other. Cagliari prov.: “*Meinertophilus superbus* (Mein.)”, “Sardegna/Sarrabus/Magg. [= May] 1872/R. Gestro [leg.]”, 1 ex [in Silvestri 1898: 685, as *Meinertophilus superbus* (Meinert)] (MGE).

General distribution. Europe: Italy (Sardinia, Sicily), Spain; North Africa: Algeria, Morocco (Brölemann 1921; Attems 1929; Zapparoli & Minelli 2005).

Chorotype. W-Mediterranean.

Ecological notes. No detailed records on elevation range but one site at 650 m a.s.l.; no epigeic habitat data; no records from caves.

Remarks. The record published by Silvestri (1898) has been re-examined and its identification is confirmed.

Villacidro, near Monte Anzeddu, 500 m, 32S 04669031 4361072, leaf-litter sifting: 10.XI.2006, MZ, 1 ex (CMZ).

Cave. No records.

Other. Cagliari prov.: “*Chaetechelyne vesuviana* New./Flumentorgiu (Sardegna)/Maggio [= May] 1894 Solari”, “*Chaetochelyne* [sic] *vesuviana* New./Flumentorgiu/ (Sardegna)–V-1894 Solari [leg.]”, 1 ♀ [in Silvestri 1898: 686, as *Chatechelyne* [sic] *vesuviana* (Newport)] (MGE).

General distribution. Europe: Croatia, France (mainland), Hungary (?), Italy (mainland, Sicily, Sardinia), Portugal (mainland), Romania (south-west?), Slovenia, Spain (mainland, Balearic Isl.), Switzerland (Minelli 1982a; Kos 1992; Stoev 1997); the species is probably present also in North Africa (Tunisia) and Corsica (*cf.* Minelli 1982a); records from Central Europe (Austria, Belgium, Germany, Great Britain, Luxemburg, The Netherlands) are mostly related to anthropogenic habitats (Remy & Hoffmann 1959; Eason 1964; Jeekel 1977; Barber 1985; Spelda 1991; Lock 2000; Spelda 2005; Lindner 2007); introduced in North America (Eason 1964). The European distribution of the species has been revised by Lindner (2007).

Chorotype. W-Mediterranean.

Ecological notes. 0–1100 m; mostly in oakwoods (*Quercus ilex*, 13 sites; *Quercus* sp., 3 sites; *Q. pubescens*, 1 site) but also in *Acer* sp. woods (1 site); often in open and shrub Mediterranean habitats (*Pistacia lentiscus*, 3 sites; maquis, 2 sites; *Cistus* sp., 1 site; under *Helichrysum* sp., 1 site; one generic record from meadows is also known); also in *Nerium oleander* shrubs (1 site); occasionally in caves (2 sites, 400–1040 m; troglobi species). Sixteen records from endogeous habitats. See also Minelli (1983a) and Minelli and Iovane (1987).

Remarks. The record of *Geophilus canestrinii* Fedrizzi, 1876b quoted in Fanzago (1881b) refers to this species according to Attems (1929). Part of the records from Sardinia published by Silvestri (1898) under this species (1 specimens from Flumentorgiu) have been re-examined and their identification is confirmed. Subgeneric assignment according to Minelli (1982a).

Villasimius, soil washing and Berlese extraction: 22.III.2008, LF, 1 ex (CMZ).

Cave. No records.

General distribution. Europe: France (mainland), Greece (mainland), Italy (mainland, Sicily, Sardinia) Spain (mainland) (Brölemann 1930; Zapparoli 2002; Zapparoli & Minelli 2005; Minelli 2006); also recorded from Romania (Dobrogea) (Matic 1972).

Chorotype. Mediterranean.

Ecological notes. 0–1000 m; mostly in oakwoods (*Quercus ilex*, 9 sites; *Quercus* spp., 2 sites) but also in Mediterranean shrub habitats (*Cistus* sp. and *Pistacia lentiscus*, 1 site; *Cistus* sp. and *Juniperus* sp., 1 site; *Arbutus unedo*, 1 site; *Juniperus* sp., 1 site); no records from caves. Thirty-one records from endogeous habitats. See also Minelli (1983a) and Minelli and Iovane (1987).

39. *Schendyla montana* (Attems, 1895)

Literature records

None.

Material examined

Epigaeic. Cagliari prov.: Iglesias, Cantoniera Marganai, 490 m, 32S 0462272 4354677, *Quercus ilex* wood, leaf-litter sifting: 9.VI.2004, GN, 1 ♂ 45 lp, body length 10.0 mm (CMZ). Iglesias, Case Marganai, 700 m, 32S 0462853 4355582, Conecofor Plot, *Quercus ilex* wood, leaf-litter sifting: 10.XI.2006, GN, 1 ♂ 47 lp,

body length 7.5 mm (CMZ). Iglesias, Conca Margiani, 725 m, 32S 0462470 4357011, clearing, under stones: 15.XI.2006, BNW, 1 ♂ 49 lp, body length 15.5 mm (CMZ).

Cave. No records.

General distribution. Europe: Austria, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, France (mainland), Greece (mainland), Italy (mainland, Sardinia), Republic of Macedonia, Romania, Slovenia, Hungary (Attems 1929; Bröleemann 1930; Loksa 1956; Matic 1972; Kos 1992; Foddai *et al.* 1995; Stoev 1997, 2002; Tajovský 2001; Zapparoli 2002; Minelli 2006; Iorio 2008); recorded also from Tunisia and Sicily by Silvestri (1896a, 1897) and then copied by Attems (1929), records from Sicily are included in Foddai *et al.* (1995) but not in Zapparoli and Minelli (2005).

Chorotype. S-European.

Ecological notes. 490–720 m; in *Quercus ilex* woods (2 sites); no records from caves.

Remarks. No previous records of this species are known from Sardinia.

Chorotype. European.

Ecological notes. 0–1000 m; in *Quercus ilex* woods (7 sites), in *Pistacia lentiscus* (3 sites), *Cistus* sp. and *Juniperus* sp. (1 sites) shrubs as well as in maquis (1 sites); one generic record from meadows is also known; also in riparian habitats (under *Populus* sp., 1 site); three records from caves (750–1040 m; trogloxene species). Thirteen records from endogeous habitats. See also Minelli (1983a) and Minelli and Iovane (1987).

Remarks. *Geophilus insculptus* Attems, 1895 has recently been demonstrated to be identical to *G. alpinus* Meinert, 1870, and *G. alpinus* has been explicitly adopted as the valid name for this species (Spelda 1999, 2006). Records of *G. vinciguerrae* Silvestri, 1894, *G. proximus* C.L. Koch, 1847 and *G. henroti* Manfredi, 1953, referred by Minelli (1983b) to *G. insculptus*, are here referred to *G. alpinus*.

Villacidro, near River Leni, 300 m, 32S 0469793 4361088, under stones in *Eucalyptus* sp. plantation: 9.XI.2006, GN, 2 exx (CNBFVR).

Cave. No records.

Other. Nuoro prov.: “*Geophilus carpophagus* Leach”, “M.te Gennargentu/Magg. [= May] 1871/R. Gestro [leg.]”, 1 ♂, 1 ♀ [in Silvestri 1898: 686] (MGE).

General distribution. Europe: Albania, Belgium, Croatia, Czech Republic, Denmark (mainland), Finland, France (mainland, Corsica), Germany, Great Britain, Greece (Ionian Isl., Southern Sporades, Crete), Ireland, Italy (mainland, Sicily, Sardinia), Latvia, Montenegro, Norway, Poland, Portugal (mainland, Azores Isl., Madeira Is.), Romania, Slovak Republic, Slovenia, Spain (mainland, Balearic Isl., Canary Isl.), Sweden, The Netherlands; North Africa: Algeria, Morocco, Tunisia; West Asia: Palestine, Turkey.

Chorotype. European.

Ecological notes. 300–1800 m; mostly in oakwoods (*Quercus ilex*, 5 sites; *Quercus* spp., 2 sites), also in pinewoods (1 site), garrigue (1 site) and montane formations (*Alnus* sp. shrubs, 1 site); vaguely quoted in open habitats (1 site); single records from *Eucalyptus* sp. plantations (1 site) and agricultural habitats (hazel groves, 1 site) are also known; rarely in caves (1 site; trogloxene species). Five records from endogeous habitats. See also De Miranda Restivo (1982), Minelli (1983a) and Minelli and Iovane (1987).

Remarks. The record of *Geophilus sodalis* Bergsøe & Meinert, 1866 published by Costa (1885) is referred to this species following Pocock (1890) and Attems (1929). Part of the records from Sardinia published by Silvestri (1898) under this species (two specimens from Gennargentu) have been re-examined and their identification is confirmed.

44. *Geophilus fucorum* Brölemann, 1909a

- 1) *Geophilus fucorum* Brölemann, 1909: Minelli 1983a: 5 [pars?].

Literature records

General. Sardinia (2, 4, 5).

Epigeic. Sassari prov.: Molarotto Is. (1, 3, 6). Oddastru, humus of *Pistacia lentiscus*, *Quercus ilex* and *Cistus* sp. (1, 6). Olbia, surroundings (1, 6). Porto Cervo, Monte Villico (1, 6). San Pasquale, meadow with mosses and *Quercus ilex* (1, 6). Sant' Antonio, La Magione (= Maciona) (1, 6). Oriostano prov.: Oriostano (1, 6).

Cave. No records.

Material examined

Epigeic. Sassari prov.: Asinara Is., Cala Reale, under stranded *Posidonia*, m 0-1, hand searching: 21.X.2009, 1 ex, LP (CMZ); ibidem, Porto Pagliaccia, under stranded *Posidonia*, m 0-1, hand searching: 22.X.2009, 1 ex, LP (CMZ).

Cave. No records.

General distribution. Europe: France (mainland Mediterranean coast), Italy (mainland, Sicily, Sardinia) (Brölemann 1930; Zapparoli & Minelli 2005; Minelli 2006; Minelli & Bonato in press); also recorded from Majorca Is. (Balearic Isl., Spain) (Capuse 1975, as *Pachymerium dragani* Capuse, 1975; Minelli 2006); doubtfully quoted from the Devonshire coast (England) by Eason (1964). Minelli (2006) raised *Geophilus fucorum seurati* Brölemann, 1924, from Algeria, to species rank and stated that records from regions other than North Africa are uncertain.

Chorotype. W-Mediterranean.

Ecological notes. A littoral species (2 sites under stranded *Posidonia*), but two records from *Quercus ilex* woods are also known (Minelli 1983a).

Remarks. Records from non-littoral localities (Oddastru; Porto Cervo, Monte Villico; San Pasquale; Sant'Antonio, La Magione: Minelli 1983a) are uncertain and may refer to *G. osquidatum* Brölemann, 1909.

Literature records

General. Sardinia (2, 3, 4).

Epigeic. Sassari prov.: Lago di Coghinas, humus of *Quercus* spp. and *Cistus* sp. (1, 5). Oddastru, humus under *Pistacia lentiscus*, *Quercus ilex* and *Cistus* sp. (1, 5). San Pasquale (type locality of *Geophilus piae* Minelli, 1983a) (1, 5). Nuoro prov.: Punta Sos Nidos, 1000 m (1, 5). Cagliari prov.: Guspi, meadow with *Pistacia lentiscus* (1, 5). Iglesias (5).

Cave. No records.

Material examined

No records.

General distribution. Europe: Italy (Tuscan Archipelago: Giannutri Is., Sardinia, Sicily) (Minelli 1983a; Minelli & Iovane 1987).

Chorotype. Tyrrhenian endemic, S-European affinities (?).

Ecological notes. Only one record from 1000 m a.s.l. but the species is also present at lower elevations; two records from oakwoods (*Quercus ilex*, 1 site; *Quercus* spp., 1 site); also in open Mediterranean habitats with *Pistacia lentiscus* (1 site); no records from caves.

48. *Geophilus punicus* Silvestri, 1896a

- 1) *Geophilus flavus* (De Geer) v. *punicus* Silv.: Silvestri 1898: 686.
- 2) ? *Geophilus flavidus* Koch: Verhoeff 1925a: 655.
- 3) *Geophilus longicornis* Leach: Attems 1929: 173 [pars].
- 4) *Geophilus longicornis longicornis* Leach: Attems 1949: 108.
- 5) *Necrophloeophagus longicornis* (Leach, 1815): Minelli 1978a: 157 [pars].
- 6) *Geophilus flavus* v. *punicus* Silv.: Minelli 1983b: 402.
- 7) *Geophilus flavus* (De Geer, 1778): Foddai *et al.* 1995: 10 [pars].

- 9) *Geophilus flavus* (De Geer, 1778): Zapparoli & Minelli 2005: CD [pars].
- 10) Geophilomorpha [indet.]: Grafitti 2001b: 36.

Literature records

General. Sardinia-Corsica (5). Sardinia (2, 3, 4, 6, 7, 8).

Epigeic. Nuoro prov.: Fonni, Rio Taloro (9). Cagliari prov.: Guspi (9). Quartu (1). Ussana (1).

Cave. Oliena, Lanaittu, “Grotta di Sas Ballas” 106 Sa/NU (10).

Material examined

Epigeic. Sassari prov.: Sedilo, 250 m: 14.XII.2003, AC, 1 ex 47 lp (CMZ).

Cave. Nuoro prov.: Oliena, Lanaittu, “Grotta di Sas Ballas” 106 Sa/NU: 28.VIII.1999, CO, 1 ♀ 49 lp (GSS) [in Grafitti 2001b: 36 under “Geophilomorpha”]; 28.VIII.1999, CO, 1 ♀ 49 lp (CMZ) [in Grafitti 2001b: 36 under “Geophilomorpha”].

General distribution. Europe: Italy (Sicily, Sardinia); North Africa: Tunisia (Silvestri 1896a, 1897, 1898).

Chorotype. W-Mediterranean.

Ecological notes. Only one record from 250 m a.s.l. of this epigeic species, the habitat preferences of which are unknown apart from one record from caves (trogloxene species).

Remarks. Originally described as *G. flavus v. punicus* by Silvestri (1896a), treated at species rank in the World Catalogue of Centipedes by Minelli (2006). The generic quotation of “*Geophilus flavidus* Koch” for Sardinia published by Verhoeff (1925a) is probably due to a misreading of Silvestri’s (1898) record of *Geophilus flavus punicus*. The two unidentified specimens of Geophilomorpha from Oliena, Lanaittu, “Grotta di Sas Ballas” 106 Sa/NU quoted by Grafitti (2001b) have been here examined and refer to this species.

49. *Geophilus richardi* Brölemann, 1904

- 1) *Geophilus richardi* Brölemann, 1904: Minelli 1983a: 8.
- 2) *Geophilus richardi* Bröl. 1904 [sic]: Minelli 1983b: 406.
- 3) *Geophilus richardi*: Minelli & Iovane 1987: 30.
- 4) *Geophilus richardi* (Brölemann, 1904) [sic]: Foddai *et al.* 1995: 10.
- 5) *Geophilus richardi* (Brölemann, 1904) [sic]: Foddai *et al.* 1996: 361, tab. I.
- 6) *Geophilus richardi* (Brölemann, 1904) [sic]: Zapparoli & Minelli 2005: CD.

Literature records

General. Sardinia (2, 4, 5).

Epigeic. Sassari prov.: Tempio Pausania, small meadow with mosses and humus of *Quercus suber* (1, 3,

6). Cagliari prov.: Perdaxius, meadow with mosses and *Pistacia lentiscus* (1, 3, 6).

Cave. No records.

Material examined

Epigeic. Cagliari prov.: Buggerru, near Mine of San Luigi, 347 m, 32S 0452771 4358704, leaf-litter sifting: 11.XI.2006, MZ, 10 exx (CMZ). Cala Regina: IV.2004, LF, 1 ex (CMZ).

Cave. No records.

General distribution. Europe: France (mainland), Greece (Ionian Isl.), Italy (mainland, Sicily, Sardinia).

Chorotype. Mediterranean.

Ecological notes. 0–350 m a.s.l.; only two records from *Quercus suber* and *Pistacia lentiscus*, respectively; no records from caves. See also Minelli (1983a) and Minelli and Iovane (1987).

Eurygeophilus Verhoeff, 1899a

50. *Eurygeophilus multistiliger* (Verhoeff, 1899a)

- 1) *Eurygeophilus multistiliger* (Verhoeff, 1889): Bonato *et al.* 2006: 435, figs 5–13, 19.
- 2) *Eurygeophilus multistiliger* (Verhoeff, 1889): Vadell & Pons 2008: 174.

Literature records

General. No records.

Epigeic. Cagliari prov.: Sarrabus, Campu Omu (1, 2).

Cave. No records.

Material examined

Epigeic. Oristano prov.: Ula Tirso, soil washing and Berlese extraction: 28.XII.2006, LF, 1 ♂ 47 lp (CMZ).

General distribution. Europe: Iberian peninsula (including Balearic Isl.), France (eastern Pyrenees), Italy (Sardinia) (Verhoeff 1899a; Bonato *et al.* 2006; Vadell & Pons 2008).

Chorotype. W-Mediterranean.

Ecological notes. No data, the only specimen here examined was collected in an endogeous habitat.

Remarks. The single female recorded by Bonato *et al.* (2006) has 49 lp.

Stenotaenia C. L. Koch, 1847

51. *Stenotaenia romana* (Silvestri, 1895)

- 1) *Geophilus romanus* Silvestri, 1896 [sic]: Minelli 1983a: 8.
- 2) *Geophilus romanus* Silv. 1896 [sic]: Minelli 1983b: 406.
- 3) *Geophilus romanus* Silvestri, 1896 [sic]: Foddai *et al.* 1995: 10.
- 4) *Geophilus romanus* Silvestri, 1896 [sic]: Foddai *et al.* 1996: 361, tab. I.
- 5) *Stenotaenia romana* (Silvestri, 1895): Bonato & Minelli 2008: 272, 285, figs 3, 5.

Literature records

General. Sardinia (2, 3, 4, 5).

Epigeic. Sassari prov.: Olbia (1, 5).

Material examined

No records.

General distribution. Europe: Italy (mainland, Sardinia) (Bonato & Minelli 2008).

Chorotype. W-Alpino-Apenninic endemic; European affinities.

Ecological notes. No data.

Remarks. Genus attribution according to Bonato and Minelli (2008). As the only known record of this species from Sardinia was collected near a port, its presence on the island may be related to unintentional introduction by humans.

52. *Stenotaenia sorrentina* (Attems, 1903)

- 1) *Geophilus forficularius* Fanzago 1881a: 378.
- 2) *Geophilus forficularius* Fanzg.: Fanzago 1881b: 13.

Cave. No records.

General distribution. Europe: Italy (mainland, Sardinia, Sicily?), France (Corsica?); records from other regions, mainly in the Balkans, need to be reassessed (Bonato & Minelli 2008).

Chorotype. Italian endemic; European affinities.

Ecological notes. 0–1300 m; in *Quercus ilex* woods (2 sites), under *Erica arborea* and *Arbutus unedo* (1 site); no records from caves. Eight records from endogeous habitats. See also Minelli (1983a) and Minelli and Iovane (1987).

Remarks. Genus attribution and synonymies of *Geophilus forficularius* Fanzago, 1881a and *G. abbreviatus* Verhoeff, 1925c according to Bonato and Minelli (2008). The generic quotation for Sardinia of *Geophilus linearis* C.L. Koch, 1835 published by Minelli (1978a, 1983b, in both cases as *Clinopodes l.*) and Foddai *et al.* (1995, 1996) as well as the records of Minelli (1983a, as *Clinopodes l.*, partly re-examined by Bonato & Minelli 2008), Minelli and Iovane (1987), Minelli *et al.* (1994) and Zapparoli and Minelli (2005) are also referred to this species following Bonato and Minelli (2008).

Tuoba Chamberlin, 1920

53. *Tuoba poseidonis* (Verhoeff, 1901)

- 1) *Clinopodes poseidonis* (Verhoeff, 1901): Minelli 1978a: 158.

- 4) *Geophilus* sp.: De Miranda Restivo & Guaita 1986: 35.
- 5) Geophilidae indet.: Grafitti & De Waele 1996: 33.
- 6) Geofilomorfi: Lana *et al.* 2006: 45.
- 7) Geophilidae [indet.]: Grafitti 2007b: 224, 226, 227.

Literature records

General. No records.

Epigeic. Sassari prov.: Monte Limbara (2). Tempio [Pausania] (1).

Cave. Oristano prov.: Cuglieri, Monte Santu, “Grotta di Monte Santu” 206 Sa/OR, 41 m (7). Cagliari prov.: Iglesias, “Grotta III di Monte Figu” 631 Sa/CA (4). Iglesias, “Grotta del Pipistrello” 310 Sa/CA (3, 5). Santadi, “Grotta Risorgente di Su Buddidroxiu” 2704 Sa/CA (6).

Remarks. Quotations based on specimens of uncertain identity.

Unreliable records

The following species and records are not included in the present catalogue for the reasons discussed below.

Chilopoda indet.

- 1) Chilopoda indet.: Altara 1968: 24.
- 2) [Chilopoda indet.]: Puddu 1980: 47.
- 3) [Chilopoda indet.]: De Waele 1996: 4.
- 4) Chilopoda indet.: Grafitti 2007a: 395.

Literature records

General. No records.

Epigeic. No records.

Cave. Nuoro prov.: Ulassai, “Grotta di Su Marmori” or “Grutta de Su Marmuri” 55 Sa/NU [880 m] (1, 3). Ulassai, “Grotta di Lecorci” 660 SA/NU (2). Ulassai, “Grotta del Porcellino” 692 SA/NU (4). Nuoro prov./Cagliari prov.: Monte Cardiga, Su Pranu, “Grotta S’Angurtigorgiu Mannu” 4 Sa/CA–NU, 470 m (2).

Remarks. The record of a single unidentified specimen collected in a crack of a wall 400 m from the entrance in “Grotta di Su Marmori” Ulassai (Nuoro province), quoted and defined as troglobitic by Altara (1968), probably belongs to *Lithobius doderoi*, the only species of centipede known to date from the cave. The same can be said of the generic record of centipedes quoted by De Waele (1996). The quotation of depigmented centipedes in “Grotta S’Angurtigorgiu Mannu” 4 Sa/CA–NU by Puddu (1980) probably refers to *Lithobius doderoi* or to *L. sardous*, recorded in the cave by Grafitti and Zapparoli (1995) (see above).

Lithobius (*Lithobius*) *calcaratus* C.L. Koch, 1844

- 1) *Lithobius calcaratus* C. Koch: Fanzago 1881b: 7.
- 2) *Lithobius* (*Archilithobius*) *calcaratus* C. Koch: Silvestri 1898: 683.
- 3) *Lithobius calcaratus* Koch: Verhoeff 1925a: 656.
- 4) *Lithobius calcaratus* C. Koch: Attems 1949: 116.
- 5) *Lithobius* (*Lithobius*) *calcaratus* C. L. Koch, 1844: Minelli 1978a: 154.
- 6) *Lithobius calcaratus* Koch 1844: De Miranda Restivo 1983: 113.
- 7) *Lithobius calcaratus* C.L. Koch 1844: Minelli 1983b: 408.
- 8) *Lithobius calcaratus* C.L. Koch, 1844: Foddai *et al.* 1995: 5.
- 9) *Lithobius calcaratus* C.L. Koch, 1844: Foddai *et al.* 1996: 360, tab. I.
- 10) *Lithobius lapidicola* Meinert, 1872: Zapparoli & Minelli 2005: CD [pars].

Literature records

General. Sardinia-Corsica (5). Sardinia (3, 4, 7, 8, 9).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2, 6). Sant’Anatolia (1, 2, 10).

Remarks. A W-European species quoted in Italy from mainland regions only, mostly in xerophilous habitats (Minelli & Iovane 1987; Minelli & Zapparoli 2005; Zapparoli 2006). Although repeated by the subsequent Authors (Silvestri 1898; De Miranda Restivo 1983), the old quotations of *Lithobius calcaratus* from Sassari province by Fanzago (1881b) have never been confirmed in spite of the fact the species was included in all the lists of Sardinian centipedes published to date (Verhoeff 1925a; Minelli 1978a, 1983b; Foddai *et al.* 1995, 1996). Zapparoli and Minelli (2005) tentatively assigned the record from Sant'Anatolia to *Lithobius lapidicola*, but all of Fanzago's (1881b) records are uncertain and must be referred to a different unidentified species of the same genus.

Lithobius (Lithobius) dentatus C.L. Koch, 1844

- 1) *Lithobius* (s. s.) *dentatus* C. Koch: Fanzago 1881b: 3.
- 2) *Lithobius* (s. s.) *dentatus* C. Koch: Silvestri 1898: 681.
- 3) *Lithobius dentatus* Koch: Verhoeff 1925a: 656.
- 4) *Lithobius dentatus* C. Koch: Attems 1949: 114.
- 5) *Lithobius dentatus* Koch 1844: De Miranda Restivo 1983: 114 [pars].

Literature records

General. Sardinia (3, 4).

Epigeic. Sassari prov.: Bunnari (1, 2, 5). Giave (1, 2, 5). Osilo (1, 2, 5). Porto Torres (1, 2, 5). Sant'Anatolia (1, 2). Sassari, surroundings (1, 2, 5). Sorso (1, 2, 5).

Remarks. A Central European species, mostly associated in Italy to the coniferous and broadleaved forests of the northern regions (Minelli & Iovane 1987; Minelli & Zapparoli 2005). Although Fanzago (1881b) quoted this species from many localities of the province of Sassari (see also Silvestri 1898; De Miranda Restivo 1983), its presence in Sardinia has never been confirmed by more recent data (Foddai *et al.* 1995; Zapparoli & Minelli 2005), even though the species was included in the lists of Sardinian centipedes published by Verhoeff (1925a) and Attems (1949). Old literature records must be referred to a different unidentified species of *Lithobius*, except those from Tempio Pausania published by De Miranda Restivo (1983), here re-examined and referred to *L. turritanus* (see above).

Lithobius (Lithobius) erythrocephalus C.L. Koch, 1847

- 1) *Lithobius erythrocephalus* C. Koch: Fanzago 1881b: 8.
- 2) *Lithobius (Archilithobius) erythrocephalus* C. Koch: Silvestri 1898: 683.
- 3) *Lithobius erythrocephalus* Koch: Verhoeff 1925a: 656.
- 4) *Lithobius erythrocephalus* C. Koch: Attems 1949: 113.
- 5) *Lithobius (Lithobius) erythrocephalus* C. L. Koch, 1847: Minelli 1978a: 154.
- 6) *Lithobius erythrocephalus* Koch 1847: De Miranda Restivo 1983: 114.
- 7) *Lithobius erythrocephalus* C. Koch: Minelli 1983b: 403.
- 8) *Lithobius erythrocephalus* C. L. Koch, 1847: Foddai *et al.* 1995: 6.
- 9) *Lithobius erythrocephalus* C. L. Koch, 1847: Foddai *et al.* 1996: 360, tab. I.

Literature records

General. Sardinia-Corsica (5). Sardinia (3, 4, 7, 8, 9).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2, 6).

Remarks. A European species, mostly spread in the whole continent except for its western part; also present in Near and Middle East; introduced in Iceland and in Saudi Arabia; known in Italy from all regions (Zapparoli and Minelli 2005; Zapparoli 2006); records from Azores Isl., Great Britain, Madeira Is., Spain and North Africa are not reliable and due to misdeterminations (Eason & Serra 1981; Barber 1985; Eason 1985). Although repeated by the subsequent Authors (Silvestri 1898; Verhoeff 1925a; Attems 1949; Minelli 1978a; De Miranda Restivo 1983; Foddai *et al.* 1995, 1996), the single quotation from Sardinia by Fanzago (1881b) has never been confirmed (see also Minelli 1983b) and probably refers to *Lithobius turritanus*.

Lithobius (Lithobius) infossus Silvestri, 1894

- 1) *Lithobius dahli* Verh.: Manfredi 1956: 207.
- 2) *Lithobius dahli* Verh.: Cerruti 1968: 231, fig. 12.
- 3) *Lithobius dahli* Verhoeff: Puddu and Piroddi 1974: 176.
- 4) *Lithobius (Lithobius) dahli* Verhoeff, 1925: Minelli 1978a: 155.
- 5) *Lithobius dahli* Verhoeff: Cassola 1982: 670, 695, 707.
- 6) *Lithobius dahli* Verh. 1925: De Miranda Restivo 1983: 114 [pars].
- 7) *Lithobius dahli* Verh. 1925: Minelli 1983b: 408.
- 8) *Lithobius (Lithobius) dahli* Verhoeff, 1925: Minelli 1985: 40 [pars].
- 9) *Lithobius dahlii* Verhoeff, 1925: Foddai *et al.* 1995: 6 [pars].
- 10) *Lithobius dahlii* Verhoeff, 1925: Foddai *et al.* 1996: 360, tab. I. [pars].
- 11) *Lithobius dahlii* Verhoeff, 1925: Zapparoli & Minelli 2005: CD [pars].

Literature records

General. Sardinia-Corsica (4). Sardinia (5, 7, 9, 10).

Epigeic. Nuoro prov.: Nuoro (6).

Cave. Nuoro prov.: Oliena, Monte Corraso, “Grotta S’Abb’ a Medica” 335 Sa/NU (1, 2, 3, 8, 11).

Remarks. The identity of *Lithobius infossus* with *L. dahlii* has been recently stated (Zapparoli 2006). The geographic range of this species includes Peninsular Italy, from Liguria to Basilicata, and Sicily, where it is common in *Quercus* woodlands but also in other epigean habitats as well as in caves (Minelli & Iovane 1987; Zapparoli 2006); single records from northern Italy are also known (Lombardy, Venetia), probably associated to introduced populations. Few data have been also published from Sardinia, related to three caves (Manfredi 1956; Zapparoli 1982, both as *L. dahlii*; De Miranda Restivo & Guaita 1986, as *L. pilatoi* Matic, 1968) and one epigeic site (De Miranda Restivo 1983, as *L. dahlii*). Cassola (1982: 670), who quoted the species under *L. dahlii*, considered the presence of *L. infossus* in Sardinia as uncertain but provided no evidence strengthening this opinion. However, the first Sardinian record of this species, published from a cave of the Nuoro province under *L. dahlii* by Manfredi (1956), seems really unreliable as based on one immature male and one larva. Moreover, subsequent records from a cave near Corongiu de Mari (Cagliari province), published by Zapparoli (1982) under *L. dahlii* and then copied by Grafitti and Zapparoli (1995) and Grafitti and De Waele (1996), here re-examined, must be referred to *L. nuragicus* (see above); to this species also probably belong the records from a nearby cave of the same karst area published by De Miranda Restivo and Guaita (1986) under *L. pilatoi* (= *L. dahlii* according to Zapparoli 1982). The assumption of Cassola (1982) seems therefore confirmed, as no consistent data are available for this species in Sardinia, in spite of the probably erroneous epigeic quotation from Nuoro by De Miranda Restivo (1983) under *L. dahlii*.

Although they almost certainly belong to one or two different species of *Lithobius*, the identity of the Sardinian records of *L. dahlii* published by Manfredi (1956), then copied in many checklists and catalogues of the local subterranean and epigeic centipede fauna (Cerruti 1968; Puddu & Piroddi 1974; Minelli 1978a; Cassola 1982; De Miranda Restivo 1983; Minelli 1983b, 1985; Foddai *et al.* 1995, 1996; Zapparoli & Minelli 2005), still have to be checked, as well as those by De Miranda Restivo (1983).

Lithobius (Lithobius) lucifugus L. Koch, 1862

- 1) *Lithobius lucifugus* L. Koch: Fanzago 1881b: 9.
- 2) *Lithobius (Archilithobius) lucifugus* L. Koch: Silvestri 1898: 683.
- 3) *Lithobius lucifugus* Mein (?): Verhoeff 1925a: 656.
- 4) *Lithobius lucifugus* C. Koch: Attems 1949: 113.
- 5) *Lithobius lucifugus* Koch 1862: De Miranda Restivo 1983: 115.
- 6) *Lithobius lucifugus* L. Koch: Minelli 1983b: 402.

Literature records

General. Sardinia (3, 4, 6).

Epigeic. Sassari prov.: Sassari (1, 2, 5).

Remarks. A European species mostly related, in Italy, to alpine and sub-alpine habitats of the northern regions (Minelli & Iovane 1987; Zapparoli & Minelli 2005). The single record by Fanzago (1881b) from a low altitude area of Sardinia (Sassari, see also Silvestri 1898 and De Miranda Restivo 1983) is unreliable, even though the species was included in the list of the Sardinian centipede fauna published by Verhoeff (1925b). Minelli (1983b) suggested that this record could be based on misidentified specimens of *Lithobius pilicornis* but, as in Sardinia this species is confined to the Gennargentu area between 800 and 1300 m (see above), this interpretation is rejected. The Sardinian record of *L. lucifugus* probably refers to *L. turritanus*.

Lithobius (Lithobius) melanops Newport, 1845

- 1) *Lithobius melanops* Newp.: De Miranda Restivo 1986: 45.

Literature records

Epigeic. Cagliari prov.: Monte [dei] Sette Fratelli, NW slope, *Quercus ilex* and *Phyllirea*, 500 m (1).

Remarks. A European species. The above-mentioned record from Monte Sette Fratelli published by De Miranda Restivo (1986) needs to be confirmed.

Lithobius (Lithobius) mutabilis L. Koch, 1862

- 1) *Lithobius mutabilis* L. Koch: Fanzago 1881b: 10.
- 2) *Lithobius (Archilithobius) mutabilis* L. Koch: Silvestri 1898: 683.
- 3) *Lithobius mutabilis mutabilis* L. Koch: Attems 1949: 115.
- 4) *Lithobius (Lithobius) mutabilis* L. Koch, 1862: Minelli 1978a: 154.
- 5) *Lithobius mutabilis* Koch 1862: De Miranda Restivo 1983: 116.
- 6) *Lithobius mutabilis* C. Koch: Minelli 1983b: 403.
- 7) *Lithobius mutabilis* Koch: De Miranda Restivo 1986: 44.

Literature records

General. Sardinia-Corsica (4). Sardinia (3, 6).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2, 5). Cagliari prov.: Monte [dei] Sette Fratelli, maquis, 300 m (7).

Remarks. A Central European species, mostly related to mesophilous woodlands, recorded in Italy in almost all regions except the western Alps and Sicily (Minelli & Iovane 1987; Minelli & Zapparoli 2005; Zapparoli 2006). Although Fanzago (1881b) and, recently, De Miranda Restivo (1986) quoted this species from the

provinces of Sassari (without a clearly defined number of specimens examined) (see also Silvestri 1898; De Miranda Restivo 1983) and Cagliari (a female), respectively, its presence on the island is not confirmed (see also Minelli 1983b); all the Sardinian records must be referred to an unidentified species of *Lithobius*.

***Lithobius (Lithobius) muticus* C.L. Koch, 1847**

- 1) *Lithobius muticus* C. Koch: Fanzago 1881b: 10.
- 2) *Lithobius (Archilithobius) muticus* C. Koch: Silvestri 1898: 683.
- 3) *Lithobius muticus* C. Koch: Attems 1949: 115.
- 4) *Lithobius (Lithobius) muticus* C. L. Koch, 1847: Minelli 1978a: 155.
- 5) *Lithobius muticus* C. Koch: Minelli 1983b: 402.
- 6) *Lithobius muticus* C.L. Koch, 1847: Foddai *et al.* 1995: 6.

Literature records

General. Sardinia-Corsica (4). Sardinia (3, 5, 6).

Epigeic. Sassari prov.: Sassari, surroundings (1, 2).

Remarks. A European species recorded in Italy only in northern regions, where it is associated with woodlands, open alpine habitats and caves (Minelli & Iovane 1987; Minelli & Zapparoli 2005). Although Minelli (1978a) and Foddai *et al.* (1995) generically quoted *L. muticus* from Sardinia, the single record by Fanzago (1881b), copied in Silvestri (1898), has never been confirmed. The species is not included in the most updated checklists of the centipede fauna of the island (Minelli 1983b; Zapparoli & Minelli 2005) and the old literature records must be referred to a different unidentified species of *Lithobius*.

***Lithobius (Lithobius) ribauti* Chalande, 1907**

- 1) *Lithobius ribauti* Ch.: De Miranda Restivo 1978: 41.

Literature records

Epigeic. Cagliari prov.: Monte [dei] Sette Fratelli, 300 m (1).

Remarks. Species only known from south-western France (Pyrenees, Montagne Noire) (Chalande 1907; Brölemann 1930). The record from Sardinia, based on three unsexed specimens quoted in a congress abstract (De Miranda Restivo 1978) but not confirmed in the subsequent paper *in extenso* (De Miranda Restivo 1986), is unreliable and should refer to an abnormal specimen of *Lithobius castaneus*.

***Lithobius (Lithobius) stygius* Latzel, 1880**

- 1) *Lithobius stygius* Latz.: De Miranda Restivo & Guaita 1986: 32.

Literature records

Cave. Cagliari prov.: Iglesias, “Grotta di Santa Aintroxia” 129 Sa/CA (1).

Remarks. Species known only from Balkan caves (Latzel 1880; Stoev 2001b). The record from Sardinia, based on a single female, is unreliable and due to a misidentification. From the same cave De Miranda Restivo and Guaita (1986) also quoted *Lithobius alpicosiensis*, another unreliable record probably due to a misidentification, here referred to *L. turritanus* (see above).

***Monotarsobius turritanei* Restivo De Miranda i. l. in Cassola, 1982 (*nomen nudum*)**

- 1) *Monotarsobius turritanei* n. sp. Restivo de Mir. i. l.: Cassola 1982: 708.
- 2) *Lithobius turritanei* n. sp.: Grafitti 1987: 36.

Literature records

General. Sardinia (1).

Cave. Sassari prov.: Muros, Monte Tudurighe, “Grotta dell’Inferno” or “Grotta del Diavolo” 48 Sa/SS, 320 m (2).

Remarks. This binomial has been quoted in two general papers on the Sardinian cave fauna (Cassola 1982; Grafitti 1987). It refers to an unsexed specimen from “Grotta dell’Inferno”, Muros, Monte Tudurighe, Sassari province (Grafitti 1987), collected on June 2nd, 1974, about 150 m from the entrance, in the principal branch under a stone on moist soil by Sardinian biospeleologist G. Grafitti (G. Grafitti pers. comm.). The formal description of this specimen has never been published and no specimens seem preserved under this name in the collection of the institution where M.A. Restivo de Miranda worked since the end of her career, the Dipartimento di Biologia Animale ed Ecologia, Parassitologia (formerly Istituto di Zoologia), Università degli Studi, Cagliari (F. Fois, pers. comm.). *Monotarsobius turritanei* is therefore here considered a *nomen nudum*. In the same cave from where the original specimen was collected, two males of *L. turritanus* were also collected in 1899 by G. Doria (see above).

***Scolopendra cingulata* Latreille, 1829**

- 1) *Scolopendra cingulata* Latreille, 1829: Minelli 1978a: 156.

Literature records

General. Sardinia-Corsica (1).

Remarks. Although widespread in the Mediterranean region, this species has never been quoted from either Sardinia or Corsica (Brölemann 1930; Foddai *et al.* 1995, 1996; Simaiakis & Mylonas 2008). The generic record for this area in Minelli (1978a) is certainly due to a misprint.

***Henia montana* Meinert, 1870**

- 1) *Chaetechelynae montana* Mein., 1870: Attems 1929: 240.
- 2) *Chaetechelynae montana* Mein., 1870: Attems 1949: 110.
- 3) *Chaetechelynae montana* Meinert, 1870: Minelli 1978a: 159.

Literature records

General. Sardinia-Corsica (3). Sardinia (1, 2).

Remarks. Species known from Croatia, France (mainland, Corsica?) and Italy (mainland) (Brölemann 1930; Kos 1992; Stoev 1997; Zapparoli & Minelli 2005). The only records for *H. montana* in Sardinia are the generic quotations by Attems (1929, 1949) and the mention by Minelli (1978a) in the centipede fauna of the Sardinia-Corsica geographic complex. As in his revision of the geophilomorph centipedes belonging to *Henia* and *Chaetecheline*, Minelli (1981) did not unequivocally include Corsica and Sardinia in the range of the species, and as its presence has not been confirmed by recently collected materials, in spite of the intensive research, records of *H. montana* in Sardinia are here considered unreliable.

Species inquirendae

Cryptops (Cryptops) breviunguis A. Costa, 1882

- 1) *Cryptops breviunguis* A. Costa 1882: 28, 40.
- 2) *Cryptops punctatus* Koch: Verhoeff 1925a: 655 [pars].
- 3) *Cryptops (Cryptops) anomalans* Newp. 1844: Attems 1930: 221, figs 280–286 [pars].
- 4) *Cryptops anomalans* Newp.: Attems 1949: 111 [pars].
- 5) *Cryptops anomalans* Newport, 1844: Minelli 1978a: 156 [pars].
- 6) *Cryptops breviunguis* Costa, 1882: Minelli 1983b: 402.

Literature records

General. Sardinia-Corsica (5). Sardinia (2, 3, 4, 6).

Epigaeic. Cagliari prov.: Cagliari area (type locality of *Cryptops breviunguis* A. Costa, 1882) (1).

Cave. No records.

Remarks. *Cryptops breviunguis* was established on an undetailed number of specimens from the Cagliari area (Sardinia) and originally compared with *C. punctatus* C.L. Koch, 1847, from Dalmatia (Croatia), by Costa (1882). The original description of the new taxon is very defective and its type locality is the only collecting site known.

Silvestri (1898) supposed *C. breviunguis* to be a junior synonym of *C. hortensis* (at that time believed to have been described by Leach, 1815 instead of Donovan, 1810, see Jeekel (1999)) but, in his monograph on the world Scolopendromorpha, Kraepelin (1903: 45) later considered *C. breviunguis* and *C. punctatus* as junior synonyms of *C. anomalans* Newport, 1844, disregarding Silvestri's (1898) proposal. Prior to Kraepelin (1903), the only records of *C. anomalans* from Sardinia were those published by Silvestri (1898), later assumed of uncertain identity by Minelli (1983b) or based on misidentified specimens of *C. trisulcatus* (see above).

The generic quotations of *C. anomalans* from Sardinia (Verhoeff 1925a, as *C. punctatus* C.L. Koch, 1847; Attems 1930, 1949; Minelli 1978a) refer therefore either to the unreliable records of Silvestri (1898) or, as Kraepelin's (1903) taxonomic view was followed by all subsequent authors (e.g., Attems 1930; Brölemann 1930; Matic 1972), to the original description of *C. breviunguis* by Costa (1882).

Although *C. breviunguis* has been considered an unrecognizable species by Minelli (1983b), its identity with *C. anomalans* is currently accepted in the World Catalogue of Centipedes by Minelli (2006). However, this interpretation should be rejected as *C. anomalans* has never been found in Sardinia in spite of intensive faunistic research (Zapparoli & Minelli 2005), and its presence on the island must be excluded.

An alternative interpretation of the taxonomic identity of *C. breviunguis* cannot be easily suggested. According to Minelli (1983b), the original description of this species could be based on specimens of *C. punicus* or *C. trisulcatus*, the two most common species of *Cryptops* in Sardinia, both of which have precedence over *C. breviunguis*. A critical reading of Costa's (1882) paper suggests that *C. breviunguis* may be based on specimen/s belonging to a *Cryptops* currently known as *C. trisulcatus*, as tarsus 2 of the 21st leg is described as thin ("gracile"), a condition usually found in the Sardinian specimens of this taxon. *C. breviunguis* cannot, however, be proposed with confidence as a senior synonym of *C. trisulcatus*. The type material of Costa has in fact presumably been lost (N. Maio *in verbis* 2006), as it is not present in the collections of the Zoological Museum, "Federico II" University of Naples (Italy) where the zoological material that he collected is usually stored (Maio *et al.* 1995). Besides, *C. punicus* and *C. trisulcatus*, often syntopic in Sardinia, could both occur in the vaguely indicated type locality of *C. breviunguis*, the original habitat of which has been in addition deeply modified or destroyed by the intensive urbanization which occurred in the past 60 years. *Cryptops breviunguis* is therefore considered *species inquirenda*.

A Checklist of the centipedes of Sardinia

The present-day centipede fauna of Sardinia is summarized in the checklist below. E = endemic to Sardinia, * = epigaeic but also occurring in caves, (*) = only in caves, i = introduced, i? = probably introduced.

Order SCUTIGEROMORPHA Pocock, 1895

Scutigeridae Gervais, 1837

Scutigera Lamarck, 1801

1. *Scutigera coleoptrata* (Linnaeus, 1758) *

Order LITHOBIOMORPHA Pocock, 1895

Henicopidae Pocock, 1901

Lamyctes Meinert, 1868

2. *Lamyctes emarginatus* (Newport, 1844) i

Lithobiidae Newport, 1844

Eupolybothrus Verhoeff, 1907 subgenus *Eupolybothrus*

3. *Eupolybothrus (Eupolybothrus) fasciatus* (Newport, 1845) i?

Eupolybothrus subgenus *Allopolybothrus* Verhoeff, 1907

4. *Eupolybothrus (Allopolybothrus) nudicornis* (Gervais, 1837) *

Lithobius Leach, 1814 subgenus *Lithobius*

5. *Lithobius (Lithobius) aligherus* Manfredi, 1953 (*)E
6. *Lithobius (Lithobius) castaneus* Newport, 1844 *
7. *Lithobius (Lithobius) doderoi* Silvestri, 1908 (*)E
8. *Lithobius (Lithobius) forficatus* (Linnaeus, 1758) *i
9. *Lithobius (Lithobius) inermis* L. Koch, 1856
10. *Lithobius (Lithobius) lapidicola* Meinert, 1872 *
11. *Lithobius (Lithobius) molophai* Restivo De Miranda, 1978 (*)E
12. *Lithobius (Lithobius) nuragicus* Zapparoli, 1997 *E
13. *Lithobius (Lithobius) pilicornis* Newport, 1844 *
14. *Lithobius (Lithobius) sardous* Silvestri, 1898 E
15. *Lithobius (Lithobius) sardus* Manfredi, 1956 (*)E
16. *Lithobius (Lithobius) sbordonii* Matic, 1967 (*)E
17. *Lithobius (Lithobius) turritanus* Fanzago, 1881 *E

Lithobius subgenus *Sigibius* Chamberlin, 1913

18. *Lithobius (Sigibius) micropodus* Matic, 1980 *
19. *Lithobius (Sigibius) microps* Meinert, 1868

Lithobius subgenus *Monotarsobius* Verhoeff, 1905

20. *Lithobius (Monotarsobius) crassipes* L. Koch, 1862 *

Order SCOLOPENDROMORPHA Pocock, 1895

Cryptopidae Kohlrausch, 1881

Cryptops Leach, 1815 subgenus *Cryptops*

21. *Cryptops (Cryptops) hortensis* (Donovan, 1810) *i?
22. *Cryptops (Cryptops) punicus* (Silvestri, 1896) *
23. *Cryptops (Cryptops) trisulcatus* Brölemann, 1902 *
24. *Cryptops (Cryptops)* sp. A (*)E

Plutoniumidae Bollman, 1893b

Plutonium Cavanna, 1881

25. *Plutonium zwierleini* Cavanna, 1881 *

Scolopendridae Newport, 1844

Scolopendra Linnaeus, 1758

26. *Scolopendra oraniensis* Lucas, 1846 *

Order GEOPHIOMORPHA Pocock, 1895

Himantariidae Cook, 1895

Himantarium C. Koch, 1847

27. *Himantarium gabrielis* (Linnaeus, 1767) *

Stigmatogaster Latzel, 1880

28. *Stigmatogaster gracilis* (Meinert, 1870)
29. *Stigmatogaster sardoa* (Verhoeff, 1901) *E
30. *Stigmatogaster superba* (Meinert, 1870)

Dignathodontidae Cook, 1895

Dignathodon Meinert, 1870

31. *Dignathodon microcephalus* (Lucas, 1846)

Henia C.L. Koch, 1847 subgenus *Meinertia* Bollman, 1893a

32. *Henia (Meinertia) bicarinata* (Meinert, 1870)

Henia subgenus *Pseudochaetechelyne* Minelli, 1982

33. *Henia (Pseudochaetechelyne) brevis* (Silvestri, 1896) *

Henia subgenus *Chaetechelyne* Meinert, 1870

34. *Henia (Chaetechelyne) vesuviana* (Newport, 1845) *

Schendylidae Verhoeff, 1908

Hydroschendyla Brölemann & Ribaut, 1911

35. *Hydroschendyla submarina* (Grube, 1872)

- Schendyla* Bergsøe & Meinert, 1866
36. *Schendyla armata* Brölemann, 1901
 37. *Schendyla carniolensis* (Verhoeff, 1902)
 38. *Schendyla mediterranea* Silvestri, 1897
 39. *Schendyla montana* (Attems, 1895)
 40. *Schendyla nemorensis* (C.L. Koch, 1837) *

Geophilidae Cook, 1895

- Pachymerium* C.L. Koch, 1847
41. *Pachymerium ferrugineum* (C.L. Koch, 1835)

Geophilus Leach, 1814

42. *Geophilus alpinus* Meinert, 1870 *
43. *Geophilus carpophagus* Leach, 1815 *
44. *Geophilus fucorum* Brölemann, 1909
45. *Geophilus minimus* Verhoeff, 1928 *
46. *Geophilus osquidatum* Brölemann, 1909 *
47. *Geophilus piae* Minelli, 1983
48. *Geophilus punicus* Silvestri, 1896 *
49. *Geophilus richardi* (Brölemann, 1904)

Eurygeophilus Verhoeff, 1899

50. *Eurygeophilus multistiliger* (Verhoeff, 1899)

Stenotaenia C.L. Koch, 1847

51. *Stenotaenia romana* (Silvestri, 1895) i?
52. *Stenotaenia sorrentina* (Attems, 1903)

Tuoba Chamberlin, 1920

53. *Tuoba poseidonis* (Verhoeff, 1901)

54. Geophilidae sp. nov. E

Acknowledgements

First of all, I wish to thank the Centro Nazionale per lo Studio e la Conservazione della Biodiversità Forestale “Bosco Fontana” – Corpo Forestale dello Stato, Verona (Italy), and in particular M. Zillich and F. Mason, for supporting this study, together with local staff at the Marganai and Monti Mannu region-owned forests for logistic support. Thanks to CNBFVR collaborators D. Avesani, M. Bardiani, D. Birtele, A. Campanaro, P. Cerretti, P. Cornacchia, G. Nardi, M. Tisato and D. Whitmore for help with field research, and to D. Whitmore for his review of the English language.

I am also indebted to: A. Lucchi (Dipartimento di Coltivazione e Difesa delle Specie Legnose, Università di Pisa, Italy), S. Gambari (Circolo Speleologico Romano, Rome, Italy), P. Leo (Cagliari, Italy), G. Nardi, (CNBFVR), R. Pantaleoni (Istituto di Entomologia Agraria, Università di Sassari, Italy) and E. Tramontano (Dipartimento di Scienze e Tecnologie Biomediche, Università di Cagliari, Italy) for their kind help with bibliographic research; R. Pantaleoni and his collaborators L. Fadda, F. Fiori, A. Molinu, A. Sassu and G. Serra (Università di Sassari, Sassari, Italy) for providing me with a large material from Sardinian

agroecosystems collected by pitfall traps; L. Fancello (Cagliari, Italy) for giving me his valuable collection of centipedes from Sardinian endogeous habitats; F. Fois and I. Culurgioni for information on *Plutonium zwierleini* and *Monotarsobius turritanei* in the collections of Dipartimento di Biologia Animale ed Ecologia, Parassitologia, Università degli Studi di Cagliari, Cagliari (Italy); M.A. Bologna (Dipartimento di Biologia, Università di Roma III, Rome, Italy) for his kind laboratory assistance; Sardinian biospeleologists M. Bertelli, D. Deidda, J. De Waele, G. Dussoni, L. Fancello, A. Gillono, G. Grafitti, M. Grussu, Gruppo Grotte Olbia, N. Ibba, E. Lana, C. Logias, P. Marcia, G. Marini, F. Melis, G. Merella, M. Mucedda, C. Onnis, S. Onnis, S. Papinuto, M. Pappacoda, A. Pinna, D. Piras, B. Pirodda and A. Sale for collecting cave specimens and sending them to me for identification; G. Dussoni for the photo of *Lithobius sbordonii* and information concerning this species; L. Sanna and F. Murgia for information on *Plutonium zwierleini* in caves of the Nuoro province; L. Sanna for the photo of *P. zwierleini*; F. Gasparo (Gruppo Grotte "E. Boegan", Trieste, Italy), P. Giachino and E. Lana (Gruppo Speleologico Piemontese, Turin, Italy), V. Sbordoni (Dipartimento di Biologia, Università degli Studi Tor Vergata, Rome, Italy) and A. Vigna Taglianti (Dipartimento di Biologia Animale e dell'Uomo, Università degli Studi "La Sapienza", Rome, Italy) for additional cave specimens; L. Bonato and A. Minelli (Dipartimento di Biologia, Università degli Studi, Padua, Italy), G. Edgecombe (Natural History Museum, London, United Kingdom), H. Enghoff (Natural History Museum of Denmark, University of Copenhagen, Denmark) and E. Iorio (Nice, France) for providing information and useful comments; L. Latella (Museo civico di Storia naturale, Verona, Italy), R. Poggi and G. Doria (Museo civico di Storia naturale "G. Doria", Genova, Italy) for providing me with specimens under their care; N. Maio (Zoological Museum, Naples University "Federico II", Italy) for information about A. Costa's collection of centipedes; R. Argano, P.A. Audisio, L. Pavese, C. Utzeri and A. Vigna Taglianti (Dipartimento di Biologia Animale e dell'Uomo, Università degli Studi "La Sapienza", Rome, Italy); M. Bologna, G. M. Carpaneto and A. Di Giulio (Dipartimento di Biologia, Università di Roma III, Rome, Italy), F. Baldari, M. Lucarelli and V. Sbordoni (Dipartimento di Biologia, Università di Roma "Tor Vergata", Italy), C. Manicastri (Museo civico di Zoologia, Rome, Italy), M. Carcupino and A. Casale (Dipartimento di Biologia, Università degli Studi di Sassari, Sassari, Italy), R. Abou Jaoudé (Viterbo, Italy), G. & P. Gardini and C. Torti (Genoa, Italy), G. Osella (Dipartimento di Biologia, Università degli Studi de L'Aquila, L'Aquila, Italy), L. Latella (Museo civico di Storia naturale, Verona, Italy), S. Taiti (Consiglio Nazionale delle Ricerche, Istituto per lo Studio degli Ecosistemi, Florence, Italy), A.B. Biscaccianti, F. Cassola, V. Vomero and M. Trizzino (Rome, Italy), D. Cillo, I. Culurgioni, F. Fois and P. Piras (Cagliari, Italy) for helping me with the field research, collecting centipedes during the past forty years.

Special thanks to G. Grafitti (Gruppo Speleologico Sassarese, Sassari, Italy) also for his constant and very valuable help with biospeleological references and suggestions.

Finally, thanks are due to an anonymous referee who made constructive comments on the manuscript.
