**TOM KOMPIER (2016) New species of *Protosticta* Selys from Vietnam with a key to the males of the *P. curiosa* group (Odonata: Platystictidae) *Zootaxa*, 4193: 347–360.**

Regrettably, neglected to indicate the type series and variation therein for one of the new species described in this paper. Here as a necessary element to validate the species description. The published paper contains a diagnosis and illustrations for the species, and added here the variation in paratypes and female characters on page 354.

***Protosticta nigra* spec. nov.**

(Figs. 12–14)

Type specimens. Holotype ♂: Tam Dao National Park, Vinh Phuc Province, northern Vietnam, 22-V-2016, T. Kompier leg. Paratypes: 1 ♂ same date, location and collector, 1 ♂ Pia Oac Nature Reserve, Cao Bang Province, northern Vietnam, 3-VI-2016, T. Kompier leg. All deposited in Naturalis Biodiversity Center, Leiden, the Netherlands.

**Variation in paratypes.** Male from Tam Dao with extensive dark markings on lateral lobes of prothorax and pale spot on metepisternum somewhat larger, covering almost half of posterior half. Right hindwing with 17 postnodal crossveins. Hindwing 25 mm, abdomen including appendages 45 mm. Male from Pia Oac with completely black prothorax, metepisternum with only minute paler spot, 21 postnodal crossveins in forewing and 19 in hindwing. Hindwing 25 mm, abdomen including appendages 46 mm.

**Female.** Not collected. Based on field observations thorax pattern as male and S9 dark.
