ROBERT A. JOHNSON, MAREK L. BOROWIEC, ROY R. SNELLING & ARTHUR C. COLE (2022) A taxonomic revision and a review of the biology of the North American seed-harvester ant genus *Veromessor* (Hymenoptera: Formicidae: Myrmicinae) *Zootaxa* 5206 (1): 1–115.

On page 10—Couplet 1 under “key to workers for species of *Veromessor*”

The published version reads:

- 1 Psammophore well developed, consisting of numerous, long, J-shaped hairs arranged in a distinct row along lateroventral margin of head (**Figure 6E**) 2
- Psammophore poorly developed, consisting of numerous, short to medium length hairs scattered across ventral surface of head; long J-shaped hairs lacking, or if present J-shaped hairs arranged in a V-shaped row not reaching posterior part of the lateroventral margin of head capsule, usually mixed with straight or evenly curved hairs (**Figures 6A–D**) 8

The correction should read as follows:

- 1 Psammophore well developed, consisting of many, long J-shaped hairs arranged in a distinct row around the outer margin (including posterior margin) of the ventral region of the head capsule, *or* J-shaped hairs arranged in a V-shaped row not reaching posterior part of the lateroventral margin of head capsule, usually mixed with straight or evenly curved hairs (**Figures 6C–E**) 2
- Psammophore poorly developed, with J-shaped hairs mostly absent with scattered straight or evenly curved hairs *or* J-shaped hairs present but not arranged in a distinct row, usually mixed with straight or evenly curved hairs (**Figures 6A–B**) 8
