**MARÍA F. DIAGO-TORO, DANIELA GARCÍA-COBOS, GIOVANNI D. BRIGANTE-LUNA & JUAN D. VÁSQUEZ-RESTREPO (2021) Fantastic lizards and where to find them: cis-Andean microteiids (Squamata: Alopoglossidae & Gymnophthalmidae) from the Colombian Orinoquia and Amazonia *Zootaxa*, 5067 (3): 377–400.**

At the beginning of page 382, in the second sentence:

*“However, for the suprageneric classification of Gymnophthalmidae we preferred the proposal of major clades as subfamilies (Pyron et al. 2013; Colli et al. 2015) rather than tribes (Goicoechea et al. 2016), since tribes classification has low phylogenetic support, except for those proposed within the **Cercosaurinae** clade, which are consistently recovered in different studies.”*

The word here we highlight in bold should be Gymnophthalminae, since the paragraph refers to the Gymnophthalmini, Heterodactylini, and Iphisini.
